Questions 1 to 57 Updated October 18, 2022

QUESTION 1:

How can we speak to someone about making a large purchase of Bitcoin

REPLY FROM BULLDOG:

Thank you for the question. Alexander has posted an excellent OTC step by step guide and link about this on MAY 10, 2022 - CHAT NOTES & ARTICLES #1 <https://99bitcoins.com/buy-bitcoin/large-amounts-otc-broker/>

in summary Step 1: Find an OTC brokering platform Step 2: Decide your terms Step 3: Agree to a price

Just as a personal note always consider the big-name players and avoid smaller more volatile operations. For Angels in Hawaii – your state laws on Crypto have been notorious over the years and I have seen some Crypto pundits on YouTube using - Caleb and Brown for OTC success in these territories – this might be worth a look if Coinbase OTC and other big names are not available to you for any reason. It is your money to allocate, and your choice please use discernment in all things.

QUESTION #2:

When we gift using Bitcoin will the recipient have to pay taxes on the gift amount?

REPLY FROM BULLDOG:

Thank you for the question. Firstly, I must stress we give no financial advice or tax advise here with these answers. Now for my personal opinion, all crypto is recorded on the blockchains and in time a full regulatory framework will be made into law for all countries, and yes Crypto taxes of some form are inevitable IMHO. Now any gift made in cash – property – fine wine – or crypto could be considered a taxable gift to the recipients. Each country or jurisdiction will have different tax laws and enforcements as of the time of this writing. Let me put it this way – if crypto can be transferred in a will – it

will have to be valued for probate here in the UK and will create a tax position. It will be wise before gifting crypto to take legal advice from your team (you will need one) and maybe provision an extra amount for this eventuality. Currently no tax at source is applied anywhere for crypto trades as of time of writing in May2022.

QUESTION #3:

What are the pros and cons of a host wallet? Coinbase is the only one that i have run across that offers one. Are there others and would this be a good option to a hardware wallet for those that are still getting up to speed with the tech.

REPLY FROM BULLDOG:

Thank you for the question. The Coinbase app, (a trading account app) where you buy and sell crypto, is a hosted wallet. They host your private keys. Putting your keys in your own hands needs a software wallet ie a very similar sounding but very different Coinbase Wallet app.

You do not need a Coinbase account to use the Coinbase Wallet app (hot wallet)

wallet.coinbase.com/faq/

help.coinbase.com/en/contact-us

Hardware offline Cold storage Vault like Arculus and Ledger and Trezor keep the private keys offline so are not hosted, but controlled by you.

Now Coinbase custody is another service level offered for Big players and Corporates which involve many layers of keys and verification but that muddies the water here as we have been told to look at Cold Storage Vault not Custody host wallets for big holdings.

QUESTION #4:

How do we find a reputable OTC dealer? How do we figure out what price to offer once we're negotiating the sale?

REPLY FROM BULLDOG:

Thank you for the question. Please see the OTC question above. Now with regards price Alexander has given his guidance many times on the price range to start buying Bitcoin ticker=BTC when its sub \$20,000, with \$10,000 optimal all in and \$5,000 bottom end its expected on the rebound back upwards.

Ok maybe I can explain it like this for more clarity to a wider group. When you set up your OTC brokerage account (the big money trading account) most likely you will not have to sit in front of a screen doing trades yourself, think a brokerage account with a stockbroker – you agree to buy some stocks – “get me 200 tesla ticker=TSLA max price 900\$” ok I will confirm the deal says the person on the phone or email– once you sign – his back on to you “its done”. Now out the back his team has traded in small pieces to keep the price stable and not spook the market -say 40 @ 820\$ and 60@\$870 and stopped trading when the price rose to 910\$ and then finished the last piece 100@899\$ now your going to pay brokerage fees as a percentage on top its called basis points For example, 10 basis points, is shown by the following $(0.01 * 10)$ or 0.1% . So the sums for this trade are : $40@820 = 32800, 60@870 = 52200$,and $100@899 = 89900$ total 174,900 plus 0.03% if 30 basis point fee of 52.47 so together its 174,952.50\$ you now own 200 shares at average price of \$874.76 and that is an introduction to Investment Accounting.

QUESTION #5:

Where can we find a tech group to help us buy & store the cryptos? I don't learn easily through reading directions and know I will need some hands on help to accomplish this.

REPLY FROM BULLDOG:

Thank you for the question. It's a learning curve, you need to get up to speed with the terms used. Alexander has posted an excellent OTC step by step guide and link about this on MAY 10, 2022 - CHAT NOTES & ARTICLES #1

IMHO the OTC brokerage firm you use will be dealing with many types of people and I suspect they will be aware of many novice investors in Crypto. Tell them what you want to achieve – see the reply above about OTC and pricing,

Let me explain it this way – with a made up for example. Give the OTC desk account manager (assigned to you) your big picture – I want to achieve a

Bitcoin -ticker=BTC purchase of \$20 million- I would like you to buy at \$20,000 and wait if current price is higher - and keep buying as it goes down and when the price hits \$10,000 fill my order. You can instruct them if you want them to hold the coins and keys in custody - again other reply has my opinion on that, or they will send it back to your own personal Vault Cold Storage Wallet - being Arculus or Ledger. I am sure they will do a small test first and keep you in the loop. Now does that sound so scary ?

QUESTION #6:

I have listened to cryptoDad and in his videos he claims that we need a third party authenticator; his suggestion is Google Authenticator. Is this needed? Thank You so much for your input/help for HAS angels.

REPLY FROM BULLDOG:

Thank you for the question. You have seen a video about security and the need for enhanced 3fa some use face recognition, and some use a 3rd party authenticator. Your wallet or app provider (whichever you choose) may ask you to upgrade security. 1fa if we can call it that is a login and password , 2fa is a further security layer check, normally a txt message sent to a mobile phone, and 3fa is an extra layer fobs OneTime authenticator and the like see [What is three-factor authentication \(3FA\)? - Definition from WhatIs.com](http://WhatIs.com) (techtarget.com) in my opinion Google Authenticator is an industry recognised and widely used security addon should you choose to use it.

QUESTION #7:

How do you transfer from Coinbase to your cold wallet.

REPLY FROM BULLDOG:

Thank you for the question. You can see a step by step walkthrough for crypto from coinbase to a hot wallet posted link below - this example uses Shiba Inu but the same principles apply to any crypto just check the ticker name Bitcoin=BTC ShibaInu =SHIB etc etc

[**How To Do A Wallet to Wallet Transfer - Human Angel Services \(activeboard.com\)**](http://activeboard.com)

QUESTION #8:

I have a Coinbase wallet and an Arculus account and card. How am I best off accumulating the Bitcoin over the long haul. Which cold wallet is best to hold long term

REPLY FROM BULLDOG:

Thank you for the question. Long term well you have the best already – Time frame I think we need to act within a short window of time to achieve the objective set. Let me use one of Alexanders old analogy - think -Its D DAY we are in the landing craft – the mission – secure the beachheads of future wealth using BTC at a minimum 10% to preserve future wealth.

You have survived basic training yippee. You have all your kit ready Arculus card - great choice for cold wallet Vault storage – lock it away and do not touch it for years once its loaded- this is held long term. You have a hot wallet Coinbase (this wallet app only is a great hot wallet choice IMHO) you are ready to go. Now the group has been told to expect BTC to fall below its current position and Alexander has given some market advice only on when could be the best time and price to start your OTC broker purchases , as in time the price will stabilize and start to rise again (this is your short windows of opportunity to acquire your digital assets) in crypto terms its called "Buying the Dip " Crypto Investing Strategy: "[Buying the Dips" \(cryptocurrencyfacts.com\)](https://cryptocurrencyfacts.com) and holding long term is to "Hodle" [HODL Definition \(investopedia.com\)](https://investopedia.com) see Alexanders post chat see "10 may#3 ZW\$(100%)/BTC(10%)/TDP(90%) principal hedged long term"

OTC (over the counter trading - or broker assisted trading as I call it) is the best for \$100,000 trades and above <https://dezentralizedfinance.com/best-90-crypto-otc-trading-desks/> , use this list with discernment but it gives lots of OTC brokers, countries and companies - coinbase is one of the biggest btw - Yambuta posted a great list and link on

[Best Bitcoin OTC Brokers: Top Crypto Over-the-Counter Trading Investments - Human Angel Services \(activeboard.com\)](https://activeboard.com)

Now with regards price (and this in my opinion will be a small window to opportunity in time) Alexander has given his guidance many times on the price range to start buying Bitcoin ticker=BTC when its sub \$20,000, with \$10,000 optimal all in and \$5,000 bottom end -before its expected on the rebound back upwards.

QUESTION #9:

Do you have a compilation of questions/answers available in one place? I work four jobs, and picking this up in bits and pieces isn't working very well because I can't review from any of my jobs and maintain a good flow of information. Thanks

REPLY FROM BULLDOG:

Thank you for the question. Yes of course I fully understand – HAS is 24/7/365 and Global so we all log in at different times to get information chat and catch up.

Please see the main area for *Crypto* postings here under "*Angel information*" – this has lots of contributors and many diverse posts and is very informative lots of varied contributors.

<https://humanangelservices.activeboard.com/f646226/crypto/>

now the *BULLDOG's POUND* can be found under "*ANGEL NETWORK*" and the running list of Q+A questions for crypto within this - is here

<https://humanangelservices.activeboard.com/f646409/bulldogs-crypto-pound/>

other shortcuts you may find of use are :

a detailed wallet to wallet transfer example -is here

<https://humanangelservices.activeboard.com/t68445302/how-to-do-a-wallet-to-wallet-transfer/>

and my big crypto perspective and personal guide post - is here

<https://humanangelservices.activeboard.com/t68276879/crypto-my-perspective-and-personal-guide-around-bitcoin-and-/>

QUESTION #10:

Hi Bulldog. I have a Coinbase acct and linked it to my bank acct. Do I now install the Coinbase wallet app ?? I want to just buy small amts of crypto and hold it for now. I'm a lil confused..thanka

REPLY FROM BULLDOG:

Thank you for the question. Looks like you have setup your Coinbase account from your question, so you are on your way- well done. The Coinbase app (Hot wallet linked to a buy/sell account and therefore your bank)- and the Wallet app by Coinbase – (a standalone no account needed hot wallet) are both great start off points.

The full explanation of both wallets for ref only is here [Coinbase Wallet](#) , and In my opinion you have the correct one and you have experience now in passing the KYC (know your client doc upload etc) which is a part of the process. You can now practice by buying the smallest amounts of crypto a few dollars and learn. One of our very kind fellow Angels Wolfegrade has offered to send a micro amount of Shiba Inu SHIB as a test to other angels-free of charge, so that might be worth a look for those who cannot acquire any amount of crypto at the moment. They can also use the free to setup no account required Wallet app by Coinbase to practice or any other free to use Hot wallet if they cannot setup a buy/sell account now.

A link for Wolfegrade's offer can be found here –

[I WILL SEND YOU A SHIBA INU COIN TO YOUR WALLET TO HELP YOU LEARN HOW TO USE CRYPTO WALLETS - Human Angel Services \(activeboard.com\)](#)

People we will gift BTC to - will need to set up a hot or cold wallet, but do not have to set up any buy/sell account with a company like Coinbase ie. (The Coinbase app)

hope that helps, thank you David

QUESTION #11:

I am trying to open a Coinbase account. It is asking for my bank login and PASSWORD. Is this normal? Is it safe?

REPLY FROM BULLDOG:

Thank you for the question. Now funny you should mention this as I have been answering this a lot. Previous questions related to security are relevant as HAS Angels we are vigilant but not in panic and never with Fear, so in that mode can I answer like this.

Let me tell you about my experience. I recently had this “link screen box “open up on a PayPal account update of my bank account details. To be honest it was a bit of a shock when the link had a “direct login to my bank details with password”. I did an antivirus update and ran a antivirus scan immediately, and then read through the pages again to calm nerves and finally completed the thing after reassuring myself all was well. You need to be cautious but not fearful.

These companies in 2022 seem to be using a 3rd party Co. to act as a "link" between them and your bank, these companies ie Coinbase and PayPal etc now do not hold your data in the old way but verify you. Instead of the old fashioned direct debit setup UK term - is it called Auto-pay in the USA ie (entering account number and bank routing /sorting codes and ticking a box). they are now required to do more due diligence on customers, and nobody wants to wait days to be setup.

I cannot see your exact screen but you are right to be weary, please read the Coinbase bank account verification notes from Coinbase account page and other notes here [**Is Coinbase Safe to Link to Your Bank Account? - Crypto Head Payment methods for US customers | Coinbase Help**](#) hope that helps david

QUESTION #12:

Can you explain what Alexander means in this post? Thank you. , out of 305 cold wallet address requests I made recently, only 15 responded (5%).

REPLY FROM BULLDOG:

Thank you for the question. You are referring to a line in the "Crazy" post sent to Has members 16-17may22 Out of respect, only Alexander can reply as to his meaning. But my personal interpretation of this (for what it's worth) is that giving away money or BTC is harder than it looks due to several reasons including apathy. To gift any Crypto, we need the recipient's wallet address. So, he would have asked people he knows for the public facing wallet address or QR code, specific to that asset he wants to gift, ie BTC within their (Arculus or other) cold storage device. He did this back in 2021 per his post and only 5% or 15 out of 305 have replied and are ready to go as of may2022. The others are wellIn the rafters / on the fence / waiting.....whatever hope that helps David

QUESTION #13:

I already purchased Arculus. Do we need to have a several Arculus cards as we will be buying a lots of Bitcoins and Cryptos and moving them to the cold wallet? I think I have seen this recommendation somewhere in the posts but not sure.

REPLY FROM BULLDOG:

Thank you for the question. You have your Arculus great- have you tested it out are you ready with all the tech? Have you done a small wallet to wallet transfer and got upto date on things? If you have fantastic well done,No

point keeping it in the box. The Arculus is the cold wallet, and your OTC broker should deposit direct into this.

A good strategy post blessing is always to have redundancy in Cold crypto storage systems, and certainly for HAS whales with super large holdings, a detailed strategy with many storage devices, kept safe in varying locations will probably be needed. My personal advice to you, is get used to the one you have, be proficient in its use first, and when you are settled post blessing, look to split your holdings and do not "put all your eggs in one basket" so to speak. Once you have acquired your BTC and other crypto, you need to look at your holdings as you do not want super large wallet positions that attract attention.

Alexander has great guidance on this matter "you want to be registered as a 10,000 - 100,000 holder" he said on his chat note of May8th2022

#2 <https://humanangelservices.activeboard.com/t68442314/may-8-2022-chat-notes-articles-2-updated/> Hope that helps David

QUESTION #14:

Alexander mentioned that you can withdraw \$50k to \$100k per day, correct me if I'm wrong. I Google can you buy a house with Bitcoin and it said no. Would someone elaborate on the spending limits for crypto currencies?

REPLY FROM BULLDOG:

Thank you for the question. Forgive me for this long and sometimes rambling answer -I simply want to lay out information from my perspective, that will answer the questions and be informative to yourself and the group at large.

I will answer your two-part question like this- The second part first. No spending limits on wallet 2 wallet transfers currently exist, you can, and some whales do, transfer huge amounts of coins (in dollar terms), from and to crypto exchanges, or OTC brokers accounts, (all are wallet to wallet transfers after all). Bitcoin and all crypto has presently no formal regulatory framework in place, but you know that already, and that is what many institutions are waiting on. You asked can you buy a house with Bitcoin? Well, can you buy a house with a trunk full of Gold bars?

Also nothing is stopping you buying and selling a house for crypto right now if both parties are willing - <https://storeys.com/calgary-home-purchased-bitcoin/> things are moving fast. State by state country by country. IMHO smart Ethereum 2.0 based contracts for house sales linked to

direct and absolute crypto settlement is something we should all look out for very soon with title deeds being issued as a NFT private token - to protect this most valuable of documents.

In my opinion things are about to change, and a new system will be introduced soon, and we have talked about how and why many times here in HAS. but then BTC will probably be in dollar terms maybe millions per coin. Taking a global view, some countries in the world like El Salvador use BTC as legal tender now, they have full regulatory framework and laws passed, citizens and investors can buy a house with BTC today.

Now back to your first point about new account limits with an on and offramp system okay. My understanding is when you are relatively new to Coinbase/and/or they have extreme volumes they will slow you down when you want to liquidate your wallet as a security measure. PayPal used to do this back in the day, you trade a few dollars nothing, you sell a big item for a few thousand and boom – account is on hold pending verification every time. Coinbase links to PayPal here in the UK as an option for all £ amounts off ramped to bank accounts originating from crypto sales. Some of this slowdown is for increased verifications and security ID checking, Coinbase kraken Gemini Binance, will want a 2fa and 3fa to allow transfers, some will want KYC / and KYC2 completed before bigger offramp transfers are allowed, Sometimes the dollar receiving banks require this to offset any counterparty risk and will insist on AML and advanced AML verifications. We have nothing to hide so in my way of thinking nothing to fear.

In Coinbase you go to your account icon, and within you can see daily limits, and account limits, all in one place- you can also unlock these by following instructions as needed. See [Why did my limits change?](#) | Coinbase Help

One final opinion I think getting an email saying “a large transfer from your account is pending – if you do not recognize this please contact us within 48 hours etc” is a good thing, sometimes going slow, well it keeps us all safe.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION #15:

Some people say XRP is gold backed and safer than Bitcoin, is this true?
Question 2: Are you at all concerned about losing your money in Bitcoins

because you can't retrieve your account or that some tech nerd had stolen it? Thanks for your time

REPLY FROM BULLDOG:

Thank you for the question. Okay I don't want to manifest any sense of fear in this 2-part question and reply. So I try to take a prayer go deep and see what my gut says – what do your feelings tell you- what did Christ reply to you? Some of this stuff you just have to feel – the light just “pops” on – the penny “drops” and BAM you relax, and you get it, or you shun it and move on – that is okay also in my eyes- it's your money and you have free will choice. But I digress now Let's deal with BTC ETH XRP etc which is safer? these coins all have a use case and have been highlighted in HAS for your consideration as Crypto asset allocations in a digital portfolio to preserve future wealth, my gut tells me these are all safe and we are good to go- how about you?

Now let's look at the second part of your question security – again let's not go into fear, let's not tailspin out into what if land but take a calm look at being safe in the modern world. I will try to explain it like this with an example– (these are not meant in any way to be condescending, but I use these examples a lot to hopefully reach a broader scope of Angels in this wide pool of Angels we have)

50 years ago, you might have been oiling the locks on doors and making sure the gate is secure because all your wealth is in your house so to speak. 30 years ago you would have to guard against taking money from the ATM in a dark alley at midnight for obvious reasons 20 years ago you would guard against fraud letters and scams being delivered by post – telling you “You have inherited a gold mine or something – just send a money order to xyz so we can release the deeds”. 10 years ago you would get a cold call on your landline and someone would ask for your credit card as a security id check before they could process you “new windfall payment “etc etc - does any of that sound familiar? we have lived through some of that and we have all hopefully taken prudent security measures to keep ourselves and our family safe.

Now in the 21st century thieves don't carry swag bags and steal your VCR – they send you phishing scam emails and use complicated ID hacks into your bank – well not if you are securing the locks on the doors, not leaving windows open and, keeping a low profile in public.

Some things on my 100 to list regards security you might want to consider:

I will get a new TDP work laptop and phone – I will install antivirus software McAfee-Bullguard-Norton or similar on all devices including phones and keep it up to date– I will not install any unsafe software “Given to me by the kids or any other source I will buy legit and install myself” I will use 2fa and 3fa on accounts that need it- I will not open unsolicited links an emails – I will not do Crypto transactions in public places attracting attention . I will put my crypto vault Arculus/ledger/Trezor backup device - seed words etc in secure safe box type bank storage, not just left under the bed. I will not have any crypto apps on my walkabout cell phone linked to my cold storage Vault – only Crypto App will be a Hot wallet app.

I am sure Scam emails will arrive to my email over time, made to look like accounts you have – “Your XYZ Account is frozen log in here to unlock and change password “stop its a scam I will tell myself. I will Log out of email, go into banking app and talk to bank/Coinbase, securely, never follow any links no matter how real it looks. Coinbase will never ask your recovery seed words – I will never give them to a computer repair man. I will create my Vault cold storage seed words and security phrases myself– I will write them down myself, I will check them, double check them, and never ever give them out. EVER. I will do a test restore of the Cold storage wallet with a small \$10 or so balance held first- from the seed words in case of disaster, just to make sure it works in case the device breaks and I have to restore to a new blank device later. I will not have any social media public facing accounts, no hashtag “big giver posts”. I will not tell my family the settlement number ever, maybe my successor once agreed and planned out. I will look and reduce my social media to a very close family minimum and just be like everybody else for security. I will create a SafeHaven with layers of dedicated staff to public face everything or use DAF to give, so I can just come up with more and more ideas for TDP.

So, after a very long reply, let me finally answer your question honestly, - am I concerned about security? – nah, I have taken control, I have taken responsibility , I’m safe. Welcome to the new world fellow Angels.

QUESTION #16:

I listened to a video with Crypto Casey talking about something that seems like a Tesla, Ferrari, supercar of Cold Wallets. But since I can not compare much (I dont understand much about Cold Wallets :)) What is your opinion... this one seems complicated but also with a lot of "functions" that seems good...??? Video: <https://youtu.be/TBhy4nb5hQA>

REPLY FROM BULLDOG:

Thank you for the question. Numerous hardware COLD wallets are available, you have to choose which one fits you best, like buying a new TV , is Samsung better than Sony , how about Phillips etc etc. I would say look for a proven track record, good market share, lots of good feedback, features you can use and understand, and good support in your country of purchase.

We must use discernment in all things – is the advert sponsored is one metric I always use – unboxing videos for example on YouTube are not impartial advice. Now that said I like the diversity and often watch different presenters who can explain in a relatable manner to me.

I think Crypto Casey has a smooth easy to hear and precise manner. In this video one of an informative series she discusses the Hardware wallet by the company BC vault see website <https://bc-vault.com/> and here is the beginners guide <https://bc-vault.com/beginners-guide/> I have never used this , but will take a look through the website now it has been pointed out here, you see, we are all learning something new today.

Hope that helps

David

QUESTION #17:

Is it not true that only ISO20022 regulated cryptos like XRP, XLM, XDC, ALGO, and IOTA will be used in the new QFS Quantum Financial System, since they are gold-backed? Bitcoin is not gold backed and was used for money laundering by the CCP and Mafias. So why is Alexander so convinced about the goodness of Bitcoin?

REPLY FROM Bulldog:

Thank you for the question. Again, without trying to manifest any fear in this conversation – please forgive me but I must ask myself why at this stage of the journey, today's question is asked? Oh well I have agreed to answer so that is what I will do now- I have previously mentioned and repeat again, out of respect - I cannot and will not presume to answer for Alexander – you must ask him yourself; I can only give my opinion based on my perspective in these Q+A.

With that said let's begin and look at the answers to your Questions and statement, the first and most incendiary of these is "Bitcoin is not gold backed and was used for money laundering by the CCP and Mafias." My reply is Ok thank you for sharing that opinion. My perspective is people who talk about BTC not being Gold backed do not get BTC and I believe it is the technology of the future , it has many of the properties of gold as a reserve asset, and is described by many as "digital Gold" and that's its value – compare that to the so called Gold backed dollars in your pocket, and the supposed gold reserves in central banks that have never been audited – well we all know how that ended, and as for the laundering part of your comment I have no knowledge of any of this, and believe it to be a false statement- BTW the last time I saw a movie the bad guys did deals with suitcases full of cash, or maybe I just watch too much TV.

Now your first part is about regulated crypto and the QFS, the ISO standards are internationally recognised framework agreements for implementing worldwide rollout of regulation, in this case - Universal financial industry message scheme see [About ISO 20022 | ISO20022](#) . Now the QFS (which I believe exists and is running) , has not been publicly acknowledged and no regulatory framework is in place to view or verify as at writing of this answer. The old system now gone = fiat money – elite central banks – collusion of elite power and influence at the highest levels. The new system is diversity and inclusion of all – i.e. CBDC and BTC ownership, especially for the majority of the worlds unbanked and currently excluded – all running on unbreakable back office and support systems to make it work i.e. QFS and infrastructure. Overseen with global governance and agreement i.e. global money authority and GESARA. I am sure what is being worked on behind the scenes by all governments will be revealed once finalized. This will be pronounced as a integrated solution and will be fully detailed and explained to all in time, all crypto will evolve merge adapt and be reborn of that, I am sure. No one can currently comment on a system not in place for public scrutiny yet. We are just early adopters and buyers into this new system, that is all.

Ok let's speculate shall we – just for fun – Ok maybe our mission is (as a group) to store and hold huge blocks of Bitcoin so our grandchildren can change the BTC governance BIP running of the thing- maybe merge with Ethereum or use less electricity (we will be a major holder if not the biggest -think about that) We would be custodians of generational wealth, to be disclosed and fully understood many years from now. It makes me think of Alexanders story he shared about gold and the keepers and his visit to China – what if this is the new mission hold BTC until the time is finally ready. But I

digress. My perspective is I just need to know IT exists only, and be ready – the why, who, how, is above my paygrade, and if I’m honest, a big distraction from my mission of ZW\$/BTC/TDP. All I know is I will take a percentage minimum 10% of settlement put into BTC and store away for future that’s it. I will then investigate gifting in BTC for the safety of all concerned and to promote its understanding and use. I also respect that some will not and want to continue with the old banking world of traditional payments and bankers – I respect that choice and freewill. Maybe Bitcoin backed by nothing is the point – money does not exist, the old system based on so called “trust” but mostly greed, did not work and has been replaced – the Shona Africans have graciously paid the worlds debts (thank you) using great wealth of reserve minerals and all new digital currencies that survive into the financial transition including BTC and ETH and all CBDC are de facto “asset or Gold backed” – and in time the concept of all money will dissolve, as need replaces greed, and wealth accumulation is replaced by abundant dispersal, maybe our groups 10% BTC strategic storage will just be used as a universal unchanging liquidity pool, creating a stable base for future generations as we will not churn and trade this like the current wealth hoarders on this planet, they create scarcity fear volatility and fix prices for greed. But its swords down now and only a balanced neutral perspective is the way forward. I just feel whilst I am curious, I do not have to understand all aspects of electricity to be able to plug in my laptop and use it – electricity great idea – I just use it and pay for it until something better comes along, like free energy with graphene technology ... yes please ... Yippee.

FunFact - Bitcoin is open source and the code available to all – its governance via groups with stakes in development are managed by the BIP or Bitcoin Improvement Program/Proposals – see [**What Is A Bitcoin Improvement Proposal \(BIP\)? - Bitcoin Magazine**](#) - BTW the seed words created for the Cold storage wallets are on a big list published as BIP39- the list can be found here in English [**bips/bip-0039.mediawiki at master · bitcoin/bips · GitHub**](#) only these worlds are used for recovery seed words.

Lastly the goodness of bitcoin part– again only Alexander can answer as to his thoughts- and I want to be very clear this is my answer to your question and my perspective only. So let me share my understanding for what its worth (IMHO) I distinguish the Man Alexander from Yosef being Christs Poet servant here - The channelled “Yosef” (and I am trying to be very careful here as I talk about subjects off topic and way way above my vibrational reach) these channellings and teachings are of the most loving and pure and honest this writer has ever heard, this is the clarion call, this is the message

that challenges us to be better – act better – think better. This is the thread of love and oneness and beauty that is the foundation for HAS and healing the soul of the world. These are profound and have changed my life. All truth and All Love. This is the voice of Christ and Yosef was the poet servant - and I am in awe of the beautiful expressions of vibration in this group and are humbled at times to be a very small part of this. These five years of training were channelled through to us so we could aspire to, and in time attain, and keep that vibration for a new fairer better world. The man Alexander going forward is very much like you and me a family man with a deep love of family -community – country – and species and overflowing with beautiful love of God. He will run his safe havens – enjoy his life and beautiful family and when he says he is one of us – I feel it – I have read it in his posts – it is sincere, heartfelt, and most of all brutally honest. I have never felt he lied to us EVER, never gave any information not for the greater good of the group EVER and his higher vibration allows him to do this, he is now Intune with his higher self/ oversoul and he sharers these answers to all problems along with his journey/story and struggle with us all. One of these solutions to the problems facing billions of humans, is the transition of money, its Distributed ledger technology- i.e. Blockchain i.e. BTC (Bitcoin being its first exponent out of the blocks) this has been presented as part of that solution. The simple formula was given to us all for our consideration ZW\$/BTC/TDP that's it, and with Love he has passed that information on. It's not the goodness of Bitcoin, but a love of people and Christs message that flows through him that is being shared. I just trust the messenger simple as that.

Personally, I am holding that Hem and taking that advice, your choice my friend is yours and I respect that. Christ is Love – I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 18:

Thank you Bulldog for your post! You write and choose your words very well. As I have learned more about cryptos over the last month or two, other intel sources had some conflicting info. I do fully respect Alexander and trust his advice as well. I too was drawn into his information through Yosef. I will utilize 10% for BTC, even though I don't understand it fully. All the best

REPLY FROM Bulldog:

Thank you for the question. We are all learning from each other – every day and that is what makes HAS a very special and unique place – stronger together as fellowship of likeminded TDP. Thank you again for your gracious

comments, but it is Christ that must get all the Glory as her love brought us all here.

Now just a recap as we go forward with our crypto – below is a few easy links to the excellent Crypto resources available on HAS to help everyone,

Please see the main area for Crypto postings under “Angel information” – this has lots of diverse posts from many talented Angels and is very informative with lots of varied content.

<https://humanangelservices.activeboard.com/f646226/crypto/>

And as all crypto transactions are basically a wallet to wallet transfer (hot to cold or Hot to Hot or cold to cold) - You can see below a step by step walkthrough for crypto with screenshots and real world examples using a Coinbase wallet to a Exodus hot wallet transfer – this example uses Shiba Inu but the same principles apply to any crypto just check the ticker name Bitcoin=BTC or here we use ShibaInu =SHIB etc etc

[**How To Do A Wallet to Wallet Transfer - Human Angel Services \(activeboard.com\)**](#)

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 19:

Hi Bulldog. Just a simple question. In light of what Alexander said in yesterday's chat about the biometrics of the Arculus not being the way to gift BTC, can you shed further light on the subject, as well as how we can best gift with BTC? I had the same plan as the individual that Alexander was responding to. Thank you so much!

REPLY FROM Bulldog:

Thank you for the question. The Arculus card is something very new and special indeed – (on a personal note I hope those of us not in the continental USA can get one in due course), but I digress as always. My understanding of this comment from chat is that you cannot preload the card and hand out to people. It's not like copying family photos/pictures onto a USB memory stick and giving out. People you want to make a Crypto gift to – well they need to send you the wallet “address” for the Arculus they have set up

themselves – so they will give you the public facing wallet code or QR code and you will gift into that. A bit like sending you a unique mailing and zip code for that person- just for that Arculus card.

For quick ref see the step by step walkthrough for wallet to wallet transfers : [**How To Do A Wallet to Wallet Transfer - Human Angel Services \(activeboard.com\)**](#)

Now the card itself has multi layered security and uses three primary types - facial and fingerprint biometric on a user's phone it also uses for security a 6-digit PIN password, finally its all secured by the chip inside the card called a "EAL 6+ secure" this contains the private encrypted keys etc. Its quite a device and a good explanation of this is shown in the link below: [**Arculus crypto card secured by mobile device biometrics unveiled | Biometric Update**](#) And here is the Arculus whitepaper FYI [**arculus-whitepaper.pdf \(getarculus.com\)**](#) I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 20 :

Thanks Bulldog. I know that Alexander favors Arculus, but I see referrals to the "I Phone" on material about it. With Android phones, is Arculus not completely operable and If so, what would be a counterpart Cold Wallet with hardware? Would Ledger Nono be a good strong alternative? Thanks much. What do you see as strongest option for safety with big numbers deposited"

REPLY FROM Bulldog:

Thank you for the question. Ok lets not go into fear on any of this ,lets break down your question into parts – firstly out of respect I must say I personally believe Alexander has proposed one of the best and safest solutions for Crypto Hardware Cold storage available in the Arculus – and I highly suggest that if you are in the continental USA you consider this as your preferred cold storage option. Now that said many Angels are not in this geography and must look for an alternative at this time in June 2022.

The Arculus product does have some requirements for your mobile device – (ie the phone or tablet the Arculus is paired and used with) – So not all older devices will work with this card.

So maybe post blessing – we all need to upgrade out-dated tech – maybe its time to ditch that old flip cellphone from yesteryear. Pre blessing testing and post blessing deployment are very different solutions.

Now an Arculus requirement is NFC and this must be turned on for your device : hardware:

(see link) [**What Is NFC on Your Phone and How Do You Use It? | Digital Trends**](#)

Software: the Arculus app needs to be loaded on your device: "The Arculus Wallet™ App is currently compatible with Android version 8.1 and later, and should work on any Android phone that supports NFC.

Back to your statement/question about Iphone – the Arculus Wallet App is compatible with IOS Version 10.0 And Later, But Only iPhone 7 And Later Models Are Supported.

To find the software version installed on your Apple device, On an iPhone, or iPad,

Simply -go to Settings > General, then tap About.

And for Android you need to check what version android it supports , if your phone has the older ver8 Oreo or 7 Nougat it probably wont work -

To check what version of Android you have: 1 Swipe up from the home screen. 2 Tap Settings. 3 Tap on the Search icon.4 Type "Software information" 5 Tap "Software information" 6 Tap "Software information" again. 7 The Android version that your phone is running will be displayed. FYI android all the versions here with names and numbers Android version history – [**Wikipedia Android version history - Wikipedia**](#)

A great source of information regarding Arculus card can be found here -

[**Frequently Asked Questions | Arculus \(getarculus.com\)**](#)

So you ask about alternatives and I say if you cannot get Arculus or for whatever reason, do not want Arculus, then I have shown two alternative options for hardware Cold wallet storage devices –

Ledger –

[**Ledger \(Cold Wallet\) Questions & Info *Can be answered by other Angels* - Human Angel Services \(activeboard.com\)**](#)

Scroll down on this post above and on may22 I show - Ledger comes in three flavours - ledger nano S the small entry level , and Nano X Bluetooth, and Nano S Plus, both last two are premium products

And the other big market leader is :

Trezor -

[Trezor \(Cold Wallet\) Questions & Info *Can be answered by other Angels* - Human Angel Services \(activeboard.com\)](#)

You ask about strongest options for security All of the above can hold billions in crypto on a single drive – its just zeros and ones, and as we are not holding hundreds of asset types – we are not crypto trading just cold storage strategic Vaulting. And to answer your question, all of these options listed above have world class proven security.

Lots of other devices are available and I must say please use your discernment when opting to store your Crypto on other devices not listed above, personally I would use one of the above. I know some others have lots of fancy features and great sales talk, but do they have a proven track record or recommendation by Alexander, well no, but It's your crypto your money and ultimately your choice.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 21 :

What is your view about trying the new App put out by Elon Musk where the initial invest\$ is \$300 then you see how the investment grows?! Some have said they tried it for 15 days & made \$7,000+. Should we try this while waiting for our RV Invitation/GCR exchanges?

REPLY FROM Bulldog:

Thank you for the question. I have not seen the app you refer to – are you sure it's an official Musk app? please beware of algorithmic get rich quick trading apps, as some are most probably a scam, especially if they seem just too good to be true. I draw your attention to a post by musk - on May 8, Musk had a new message for his 53 million Twitter followers.

"Cryptocurrency is promising," Musk wrote on Friday, "but please invest with caution!"

So, my personal view is that as we progress on our TDP path we must treat Crypto as a tool for Cold Storage future wealth generation and money distribution out, a good policy is Invest and forget and not get side-tracked into new schemes, new coins, new issues of Crypto assets, new apps, and products that will undoubtedly flood the market once we begin. Otherwise we will become Crypto asset day traders and Investors, so wrapped up, we forget about why we are here – Our Safe Havens.

IMHO We are about money out, especially once we have protected our settlement principle with a bare minimum 10% principle into BTC as advised many times by Alexander.

Put in your initial Cold storage orders with OTC broker and buy enough extra to make gifts out, and then forget crypto investing. Maybe I will do a small hobby type personal "money pool" and invest and play around in the crypto field but I know I must focus on getting to work planning my giving.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 22 :

Can you kindly do a summary with a list of articles and videos we can study to fully understand CRPTOS. Many wants to be part of your awesome advice and write ups but still need NOT encouragement but understanding. DO AN IDIOTS GUIDE TO CRPTOS.....please.! SOOO....proud of you. God bless you good works

REPLY FROM Bulldog:

Thank you for the question. Asking for a idiot guide in a few easy steps is like asking someone to explain music in 300 words – where should we start Beethoven? no too old, what about Elvis no, what about more modern, what about Billie Eilish (who ? if you don't know who that is - ask any kid..lol) too young ok, what about Christ Stapleton, too country, well what about one of my favourites Gregory Porter?..... see what I mean, so much choice, anyway as normal I digress, please forgive me, back to work david answer the question.

Ultimately you need to do the leg work, No one can do this for you, and watching a set number of videos will not be full training. Do not get into fear mode, just learn the basics at your pace, it's easy, its new, and its different, but it's not difficult. We all learnt eBay + PayPal, using our credit cards, using contactless payments at the store, and no manual was ever issued for any of that. What I will do is list in order, links packed with info and articles that will give a great overview and grounding of whats what just for you. It will never make you an expert, but it will make you proficient in getting your Crypto into Cold storage Vaults therefore protecting your settlement principle (if you so choose.)

Read the big introduction to crypto – its in 3 parts the first 2 parts are essential reading part three is just extra info and for us not essential. It can be found here <https://humanangelservices.activeboard.com/t68276879/crypto-my-perspective-and-personal-guide-around-bitcoin-and-/> You will need to understand each asset class by its ticker Bitcoin=BTC you will need to understand seed recovery words for any wallet You will need to know wallet public facing address (all in 1 above)

Pick your Cold storage hardware wallet – (your cold storage Vault) you have been presented with a strong option to consider if in the continental USA and that is Arculus – and a guide is here [Arculus \(Cold Wallet\) Questions & Info*Can be answered by other Angels* - Human Angel Services \(activeboard.com\)](#) Alternatively or if you cannot use Arculus in your location, a couple of others for consideration are Ledger see here ...[Ledger \(Cold Wallet\) Questions & Info *Can be answered by other Angels* - Human Angel Services \(activeboard.com\)](#) and Trezor are explained here[Trezor \(Cold Wallet\) Questions & Info *Can be answered by other Angels* - Human Angel Services \(activeboard.com\)](#) many many others exist but at this stage why make it over complicated.

You need to pick a hot wallet for your phone or tablet – see [Coinbase \(Hot Wallet\) Questions & Info *Can be answered by other Angels* - Human Angel Services \(activeboard.com\)](#). Remember Coinbase also do a trading account and that app is different from the free to use wallet only. So we have Coinbase app and one I use is the Exodus wallet a posting about this can be found here [Exodus \(Hot Wallet\) Questions & Info *Can be answered by other Angels* - Human Angel Services \(activeboard.com\)](#) many many others exist but at this stage why make it over complicated.

You need an OTC broker – Pick one. Coinbase is an excellent worldwide choice as one of the biggest players and many set up a Coinbase account (see above in 3) as a steppingstone to this. [Best Bitcoin OTC Brokers: Top](#)

[Crypto Over-the-Counter Trading Investments - Human Angel Services \(activeboard.com\)](#) OTC is a Crypto dealer (stockbroker for crypto) who will handle large amounts of volume and transact deals on your behalf – only you know what numbers you need to achieve - and they will fill the order for you and send Crypto to your designated Hardware storage wallet (see above in Now that is easy.

That's it – just 1+2+3+4 – and if you're just going to buy Bitcoin at 10% of settlement well you only need to think about one asset class on your wallets BTC, that is super easy, the problem is you are getting too much information rather than not having enough, this is a Crypto 101 intense course, it's more like a Crypto DoJo .

So using that analogy of a Crypto DoJo lets "wax on and wax off" - You can practice with various coins, some extremely cheap, just pennies or less, – and you should do a personal wallet to wallet transfer at least once - to get used to this – see [How To Do A Wallet to Wallet Transfer - Human Angel Services \(activeboard.com\)](#)

Re read all the crypto questions [Bulldog's Crypto Pound - Human Angel Services \(activeboard.com\)](#) they are all shown here.

Also see the Crypto area with many Angel's posting - this is packed with advice – links views and solutions <https://humanangelservices.activeboard.com/f646226/crypto/>

Do not over think this keep it simple, just because your hardware wallet supports 500 crypto assets just install the few you need. The mission is to protect your settlement principle with crypto - the advice from Alexander has been "put 10% of settlement as minimum into BTC ", use baby steps, get this done first, then move on with your other activities, or other strategic vaulted crypto holdings.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 23:

Can you check into [Strike.me](#) I wrote a post about this, but is it viable? Is [Strike.me](#) a Better Option for Buying BTC with Less Fees than an Exchange or OTC? <https://humanangelservices.activeboard.com/t68526667/is->

[strikeme-a-better-option-for-buying-btc-with-less-fees-th/?page=1#comment-68526667](https://www.strikeme.com/a-better-option-for-buying-btc-with-less-fees-th/?page=1#comment-68526667)

REPLY FROM Bulldog:

Thank you for the question. Ok let me answer this by first saying we are early adopters in the Crypto field, as we get close to full CBDC rollout and as governments legislate and issue a full regulatory framework, I am sure numerous new and innovative products will be available. For the main batch of HAS crypto newbies and some HAS whales, storing huge amounts of crypto the hardware wallets previously recommended should stand as they have a world class proven track record. Its not a matter of saving on price, we are not buying a forty dollars' worth where a ten-dollar fee is a problem, we are buying millions or even billions in one OTC order, we can afford the fees.

Now with that said above - some of these new ideas/apps and hardware look great and need testing, and maybe a few of us can do that in small scale, and report back once a full regulatory framework is in place and all the dust has settled. [Strike - A more connected world](#) and the visa card option you mention in your question looks very interesting. I have used other companies with visa linked crypto accounts before and are very good on/offboarding options.

So shall we have some fun and take a look at a few new things floating around in Crypto space – just a few examples not recommended, but here for academic learning, these show interesting ideas and come from Companies like Bannx [Baanx.com](#) and hardware lattice by grid + [GridPlus](#) and BC vault <https://bc-vault.com/> and cards like "Strike" and Tangem Home ([tangem.com](#)) also [Cryptopay](#) along with new mobiles by - PundiX BOB [PundiX's Blockchain Phone](#) and [Samsung Makes It Easier to Use Blockchain on Galaxy Devices](#) along with finance ideas like - El Salvador's Volcano bonds [Are El Salvador's Bitcoin "Volcano Bonds"](#) are possibly future game changers in the making IMHO- , some will just fail or be proved a nonstarter, some will flourish, time will tell.

But here and now this just muddies the waters in our mission to protect our settlement principles with crypto – and I repeat again the advice from Alexander has been "put 10% of settlement as minimum into BTC ", let's get this done first with proven solutions, then move on with other activities, and then use new products and have some fun as we test, report, and spread the word on crypto, whilst all the time healing the souls of the world with our Safe Havens worldwide.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 24:

CBTC/OTC Purchase process Question: 1). There are several of HAS Angels who lives in Hawaii. Due to the stringent rules & regulations of HI's governing body about crypto currencies, residents of HI are NOT allowed to buy any crypto greater than \$10K. 2). Hawaii being geographically outside of continental USA, even though we are the 50th state, most, if not all the cold wallets: Ledger, Arculus, etc., are not available for us. 3). I voiced my concern to our great leader, A, whom I respect very much, re: OTC purchase greater than \$100K post blessing and he suggested to "email the OTC Agents, once ready to buy OTC."4). I have been watching most, if not all, of the BTC, crypto videos, ad nauseum, the weblinks from our HAS members being shared with us on a daily basis. I'm a little familiar with the "language and processes" about BTC & cryptocurrencies. Given the concerns I delineated on #s:1-3 above, May I please ask your opinion, advise, etc. what are we are to do, as HI residents, to buy BTC/OTC (greater than \$100K and above) and the other cryptos post blessings, if the "cold wallets" we could not purchase bec these companies does not service HI residents?! What are the proper questions shall I ask the OTC Agents, when I email them? Appreciate your expert opinion and in assisting us or guiding us on what we need to do so we could buy BTC/OTC and the other cryptos...post blessing...that is fastly approaching...Mahalo Nui Loa.

REPLY FROM Bulldog:

Thank you for the question. Okay Aloha to you also – So without generating any fear in these answers let's take you question piece by piece and try and get you sorted. If holding or buying Crypto is illegal in your state or province its Illegal nothing more to do. We should always abide by the state and country laws where we live but must also research what is outlawed, and what is just not possible because companies do not offer services in these areas because of admin difficulties, they are two very different propositions. Headlines in papers "Crypto banned in town" usually only relates to that one company, and when fully investigated, it turns out something like - they just did not pay the local taxes or forgot to fill in the needed forms on time so they just up sticks and left ..etc etc.

So yes, some geographical areas do have backward thinking laws currently on crypto, and Hawaii is no friend if you want to acquire and hold crypto. That said my understanding is Crypto is not outlawed or banned in Hawaii, but they might slow you down making onramp fiat money payments for crypto exchanges etc from local banks I suspect it's the local anti-money laundering and KYC laws that are causing you problems in HI- one thing to note (Your money will not be in local banks but off books in Custodial accounts) so you won't have to be at the bank window explaining your business to the teller will you?.

A few internet searches show others are also in Hawaii buying and selling crypto and finding positive solutions – they probably will not have a OTC needs – These are not endorsed or recommended by this author, but are shown here for you to take a look as they relate to your area. A note of caution on the below links -please do not mention HAS or OTC volumes you need in a public open forum like the ones below and accept that most posting are of a lower fear-based vibration, that said it can still be a useful place to gain contacts and information to solve your Higher Vibrational problem with Crypto.

[*Find out where to buy Crypto in Hawaii | finder.com*](#)

[*9 Exchanges to Buy Crypto & Bitcoin in Hawaii \(2022\) \(buybitcoinworldwide.com\)*](#)

[*Hawaii Crypto - Web 3.0, NFTs, Cryptocurrency, Defi and more*](#)

[*How To Crypto Hawaii*](#)

[*Hawaii Crypto | Facebook*](#)

[*Cryptocurrency groups in Honolulu - Meetup*](#)

Second question: the outside of continental USA – yep Arculus is not for you as the app is not supported (it's only a small team I suspect, and so they limit support and Appstore availability of the cards-btw they are looking at expanding I have emailed them) so for you for now its Ledger [*Hardware Wallet Ledger*](#) or Trezor [*Trezor Hardware Wallet \(Official\)*](#) and those work in your area the app should be available from IOS or Google download store for your devices. So yes, you do have a solution. Both of these are world class solutions.

Third question – yes email the OTC brokers with your positions you want to fill and they will advise – I am sure many Hawaii residents have investments and business and non-profits based in continental USA and that is not illegal – maybe that is your solution, maybe its just because Kracken or Binance don't want the admin hassle they just refuse to trade in your province – either way you need to do the legwork and I am sure you will find a positive and legal solution for your problem.

Over the years I have noticed an ex-newsman and prominent resident of HI and crypto champion who has made a solution clear many times over the years. He suggests OTC brokerage for HI can be done with Caleb and Brown [Caleb and Brown - Your Cryptocurrency Brokerage](#) so its worth a contact, Gemini is another big player worth emailing [Hawaii | Areas of Availability | Gemini](#)

I am no USA tax expert but you should get legal and accounting advice -under current regulation , you may have to hold this in a non-personal holding, ie - corporation or LLP –or 501c non-profit-or or use trusts, or use trusts created in mainland USA states, but it can be held, of that I am sure. I would highly recommend you talk to them about all the legal solutions for your crypto positions you want to fill.

You first need to buy a storage Cold wallet device so pick one, buy it and set it up.

I would establish an account with whichever OTC broker you choose – you will need to do KYC (no not the chicken shop) but know your customer, copies of driving licences and ID checks, etc etc. (a quick tip)- if you upload pictures do not crop them or apply filters on phone or computer they will be rejected – just send whole picture. AML and AML2 being anti-money laundering checks - need filling in so more forms, with some asking for proof of funds or income statements, or bank account copies. Yep, it's a pain. Phew and you now have an account. If you want to open a small account pre blessing as many have, it has to be a non OTC brokerage and just upgrade that after for bigger sums.

You then need to work out what you are going to do in crypto – a bare minimum is 10% BTC of settlement so get your sums done, if you want more assets calculate that. Say you calculate you need £30m in crypto (just as a hypothetical number) divide that by \$20,000 (the price you have been advised to start buying at) and you get about 2500 BTC a huge amount but its where you're at.

Fourth question – I’m no expert and nothing special about me - I’m just a bit ahead of some of you in the crypto understanding- we are all learning this together, especially now as new laws are being unrolled every week worldwide – say for example this crash happens very soon you may find the legal and regulatory framework changes overnight in your province. we can only speak of the current June 10th, 2022, position.

Ok the last part of your question “proper questions shall I ask the OTC Agents “

I would just set the account up first You could just write them an email saying you want to invest a windfall (clearing soon) and need advice for over \$100,000 investments in BTC especially where you live in Hawaii, you will probably be able to pay direct from treasury account not a local bank and see what the response is. Ask if you can set it up and do all the background checks etc now and be ready. They will have all your personal details from KYC if you already have an account, but they will be used to people moving big sums into crypto and provide support and solutions.

You may not (off the bat) tell them you want to fill a (hypothetical) position of 2500 BTC once the money is all cleared your end, – please don’t lie but do not elaborate either.

When you place the big order Tell them you want to buy at \$20,000 and keep buying until it falls to \$10,000 and then go all in to fill the order.

Gemini have trading smaller accounts and OTC desks – I think Caleb and brown are just brokers and OTC agents not sure of volumes.

Its your settlement money and your responsibility to manage this – you need to write the emails and make the calls and find out, do the leg work. Think outside the box, be persistent.

I hope I have given some CAN DO ideas for you to fulfil the Z/B/T formula that will complete us all in this very lengthy Q+A, thank you BTW for staying with it and reading it all. Christ Yahushua is Love and will find a way to bless her people that I am sure, much Love to you.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 25:

Could you kindly unwind A's advice re transferring funds from custodial account to Stablecoins USDC which is gold-backed, multi-denominational, crypto- conversion capability and value secure. Is this available to multinationals? Thanks for your input and insight.

REPLY FROM Bulldog:

Thank you for the question. Okay my standard disclaimer is Out of respect only Alexander can answer for what he is thinking but I will try and give my personal opinion of what I think the comments from chat post about Stablecoins is about see the UPDATED SATURDAY 7th MAY 2022- ["Stablecoins" UPDATED - HAS Post](#) see here for what its all about. AND YEP I HAD TO SCROLL THROUGH WEEKS OF STUFF AND RUN A SEARCH TO FIND THAT ..LOL

As part of a series, he is teaching us that giving in cash post blessing and (only after you secure your Vaulted crypto % to hedge wealth), gifting in cash may not be the best option. It's just a solution part of many postings and notes trying and show us how to manage our blessing and grow our wealth and stay safe going forward.

In this post above he states cash given may be reduced by a global financial event, in fact giving BTC Bitcoin may be unstable for a while, and as many believe stable coins are the forerunners of CBDC in good time we will all use these. He was warning us of algorithmically traded unstable Stable coins that could fail, and recommended a good coin to use, being USDC which could be gifted at no loss of value should events overtake us.

You could gift in cash or in BTC or USDC stable coin. it's called "USD coin" its ticker is USDC [USD Coin | CoinMarketCap](#) please do not mix this up with other similar sounding and named coins

Its Multi-currency and Multinational because any country in the world can convert USDC to BTC and in time local CBDC in a flash no fed wire, no western union, just wallet to wallet anywhere in the world without any restriction, no forms no paperwork just easy blessing anyone you choose. All current crypto wallets I can think of anywhere in the world right now can take USDC and convert into fiat money already. You can now send me USDC now in the UK and I can send it from my hot or cold wallet and swap it into BTC or LTE or like and move it to my PayPal account and turn it into fiat UK Pounds today and then send it out to my UK bank account Today. All with no banks or forms your end. All you need is my public facing wallet address for

that asset you are sending ie USDC. I only show PayPal as an example for people, most do not even need that step – it can be converted straight from a Binance or Gemini or Coinbase app straight into local bank fiat money. It really is that easy anywhere in the world.

Now if you have an idea on the numbers you want to put into crypto – you need a Hardware wallet set up as a place to put assets prior to your OTC purchase.

If you are set up with OTC and are ready to put in the order for your BTC “big buys” you could fund your OTC account and convert fiat and hold USDC stable coin asset not fiat dollars in your OTC account- ready for your transactions.

You could then acquire more USDC stable coin for any gifting after as a safe no bank solution, keeping you out of the spotlight of banks. This is a worth much consideration, as I believe we all need to get used to crypto in our daily lives and the spread and speeding up its daily use will be a good thing.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 26:

CBTC/OTC Purchase Question: Will not download Ledger live (this is a result page of no download) [file:///home/pet/Downloads/ledger-live-desktop-2.42.0-linux-x86_64\(1\).AppImage](file:///home/pet/Downloads/ledger-live-desktop-2.42.0-linux-x86_64(1).AppImage); On a training site I tried setting up a manager page. pet@pet-ThinkPad-X1-Carbon-3rd:~\$ (chod +x Ledger-Live-*.AppImage.) Command 'chod' not found, did you mean: command 'chmod' from deb coreutils Try: sudo apt install <deb name>

[then follows a 3 PAGE TECHNICAL USERS DATA LOG – REDACTED HERE by Bulldog for users security]contd.

I am afraid to continue in case I screw up the system) Also: #2 problem: Ledge Nano S is not completing on the mobile either. I realize I have to have a wallet to send cryptos too whether it be soft or hard and nothing is jiving. I am bewildered. Can't buy the Arculus card because I do not live in the States. The UK card is expensive for me right now to try that.

REPLY FROM Bulldog:

Thank you for the question. Okay Lets all take a deep breath and let's not go down the rabbit hole of can't do, today it's all about CAN DO positive solutions and no fear mode here.

please forgive me for redacting most of the technical parts at the start of this question- but it serves no benefit to the group as a whole and it's probably better for your security I take it out. I must issue a word of caution this is not a hardware support, or computer repair forum, but I want to help Angels get setup the best I can. It may not give you the outcome you want to hear, but it will spell out practical steps to diagnose, troubleshoot, and give some long-term resolution ideas. This is a short version for publication and a much longer technical reply has been PM to you.

All HAS users I am sure, have had to look at devices and decide if any upgrade is needed to use crypto safely going forward. Some just do not have any current resources to upgrade pre-blessing and I get that, so I suggest in those cases putting a new phone (current 2022 spec) and a Crypto cold storage wallet compatible device (2022 spec) at the top of the first 100 to-do lists. Until then just watch videos read articles and absorb the information. If your tech is out of date or not compatible, it just is what it is. I suspect new hardware is needed. In fact, I am writing this on a 8-year-old computer not compatible with windows 11 so it's stuck in windows 10. But I have taken responsibility, done my research, and checked, and this modest hardware fully updated and patched, does run my Ledger software, and works with my Nano device. Yippee

Now you mentioned the phone also will not work, so I suspect we have more than just a few problems here, with out of date hardware/troublesome software - that said we have spoken here before about phone compatibility as well as laptop/tablet compatibility so check that as well - maybe question 20 will help in this matter of phone compatibility see ["QUESTION & ANSWER #20"](#)

One important thing to remember -Now if you have the entry level NanoS model it cannot pair with a smartphone as the USB connector in the box is for a pc and is different on your phone, also this model has no Bluetooth or NFC so you may need a multi USB lead upgrade kit - please see [Ledger OTG Kit | Ledger](#) (note -I think I might get one of these kits for myself - it might come in very handy)

Ledger hardware currently sell three flavours of cold storage Hardware wallets - NANO X (flagship usb-c and Bluetooth) Nano S (entry USB Type Micro-B) and NANO S plus (usb-c with new with big screen)

Only you know the exact hardware and software configurations of your setup – both laptop and phone and now have a way to check its compatibility- but you must take responsibility as you are swimming against the tide here by using a rare form of operating system in Linux Mint. You are possibly the only person here I know using Linux Mint out of some 660 core users. That said its your choice, and I respect that, so may I direct you to-

Linux mint support, - which shows these articles that may be of use [Ledger Nano Software Installation Problem - Linux Mint Forums](#)

Linux walkthrough setup video you might find of use-A good video for linux Ledger setup is here - Ledger Nano S | Linux Tutorial -<https://www.youtube.com/watch?v=e6d6PVsE-w>

When it comes to buying BTC we now have updated guidance and advice very kindly shared by Alexander in 14june22 to buy 1.111% of settlement into BTC -Bitcoin ASAP. BTC (1.111%)/ZW\$ (100%)/TDP (101.11%) we must always be fluid in our thinking, receptive to change, and flexible with our plans, as new or better ideas come forward.

I hope above and the detailed extended PM has some good and practical links and help going forward, I cannot do more than this this for you, but the explanations stand as good examples for the group at large coping with various pieces of kit, and complex software mix, whilst testing and learning Crypto.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 27:

Hi Bulldog. I've read your question and answers, but I'm a lil confused... I have a Coinbase acct and wallet...I'm trying to transfer from my Acct toy wallet....do I need to repurchase to get the Btc and USDC transferred Into my Coinbase wallet?? I've just been practicing with a few hundred dollars... Sofar...the crypto is still on n my account, but not in my Coinbase wallet.. I thank you !! urchase Question: Will not download

REPLY FROM Bulldog:

the blessing and secure our future multi-generational giving. Christ is Truly Love.

As to your second round of questions – thank you again for asking. Now ARCULUS setup is so easy you will blast through this in minutes. You can practice buying \$10 with an account at an exchange – say Coinbase in the USA (as this is online and you have no hardware its called a Hot or software wallet) – you will need to set this up, as you could choose to use them as your OTC broker to place your big order post blessing. So when you have bought a few bucks worth of crypto (which you can do that now - no waiting needed) – you can practice transfer it into your cold storage Arculus (hardware wallet) with a wallet to wallet transfer on Friday, super easy. I'm so excited for you taking the first steps – you have asked questions great, ordered the hardware superb, and now will get in your practice Yippee, all ready.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 29:

in Australia where is the safest site to buy bitcoin and where is the best for OTC buy when time comes. thank you Iain

REPLY FROM Bulldog:

Thank you for the question. Okay Iain your very kind question states when the time comes -well my friend the time is now, we are at the point you need to be doing test transfers and buying small amounts say £10 or AU\$20 and moving it around in test wallet to wallet transfers.

I have a sort of 1,2,3,4 easy steps guide in question 22 see ["BULLDOG'S CRYPTO ANSWER #22"](#)

And you need to pick a big OTC broker that deals in your state and country <https://bitcoinexchangeguide.com/bitcoin-otc-brokers/> – the biggest players are Coinbase, – Gemini, - Kracken, - Binance, – and Caleb & Brown, I think Caleb have offices in Australia .

All steps needed are in the #22 post. You just need to choose where you put your money, it's your money after all. My personal advice please avoid

smaller players – this will be a volatile time and many unsound or unproven companies without track record will fail, even in crypto.

So, get your cold storage device set up – get a hot wallet and do the small test transfers now get setup on your exchange of choice and you are ready to go for the off.

Please remember When it comes to buying BTC we now have new updated guidance and advice very kindly shared by Alexander on 14june22 to buy 1.111% of settlement into BTC -Bitcoin ASAP.

BTC (1.111%)/ZW\$ (100%)/TDP (101.11%) we must always be fluid in our thinking.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 30:

Looking for info on how to purchase bitcoin in a trust or how to transfer it into a trust? Thank you

REPLY FROM Bulldog:

Thank you for the question. Firstly, this is not offering any legal or investment advice here – this is slightly off topic but is a valid question, and I will try to explain the concepts only for Academic purposes, -this is my personal opinion and perspective only.

A trust is a private legal document under international law, it has its own category TRUST LAW , and depending how its structured the assets are not held by the originator but by the trustees.

Trusts are extremely complex. You will need a trust lawyer (attorney), and sound planning advice before the trust is executed, (signed sealed and delivered) - but they have many similar things in structure, I will briefly explain a few of the concepts below.

Settlor or Grantor / creator - Role- they relinquish control of assets to trustee

Beneficiary -Role- is primarily to receive beneficial interest from trust

Trustees - Role- They take on the lawful responsibility of asset ownership - They have "legal title" to Assets in trust with no beneficial interest. Non equitable. Duty to earmark assets.

the trust documents - normally bound together -they include:

Trust indenture. Initial contract and process being about 11-13 page rules out of 36 pages etc. Document of setup and rules-powers trustees have power to make additional clauses to enhance but not contradictory to trust purpose. This is the evidence the trust has been created . (This is a private document and is the rule book in law for how who and why).

TRUST ABSTRACT-8-10 pages average - includes but not exclusive - a Memorandum minute- (synopsis of Indenture), a Banking resolution minute , A Managers & executive agreement minute, A Trust certification minute , and A Addendum to Schedule "A". (this short doc) is normally given to banks and is a semi private document, none of these are published online ever making trusts private.

Minutes: The minutes control the trustees. All decisions must be minuted and kept.

this Keep running tally of minutes- dated and numbered, also Trust mins make the Trust Dynamic- with paperTrail

Trust manual -Given as guide to using the trust.

Now back to question about holding BTC Bitcoin or any crypto -so once a trust is set up and structured correctly - the trustee could open any account say Coinbase etc - operate any cold storage ie Arculus and buy and sell and hold any asset including cash , bank deposits , stocks , shares, Real Estate and lands , and alternative investment class assets such as crypto, all based on the trust documents created.

Trustees have a fiduciary responsibility and its taken very seriously in law - hence the saying " A breach of trust"

I Hope this is informative and has helped with peoples understanding - its shared with much Love.

UPDATE JULY 1, 2022

ANGEL QUESTION 31:

Arculus said to call [Simplex.com](https://simplex.com) who they clear with. My CITI debit card wouldn't go thru as well as other credit cards. No problems with my accounts but Arculus is saying it's something with KYC, know your customer. I gave them all the identifying info.

REPLY FROM Bulldog:

Thank you for the question. Okay I understand from the question that you are trying to buy crypto with your Arculus account – that not how I would approach this, I would propose you set up an account with a brokerage ready for OTC , it can be a non OTC account for now and link that to your bank and fill out all the KYC and AML stuff – think Coinbase – Gemini – Kraken etc , then test transfer small amounts say \$10-20 to your cold storage Arculus account. But ok you are finding a problem so let's take a look at it.

Because you bought a Arculus card (great choice btw) you can install the app and pair the card, you created your security and made the recovery sequence. Just one point to note never ever give this to anyone – with just these 24 words they can recreate your entire wallet. So you re all set up perfect, you now notice another feature of your card - a service provided to Arculus customers to buy trade and (swap in some case crypto). This extra service is not done through Arculus but a 3rd party agent who takes care of the KYC, the verification and the handling of onboarding the payments to the account, effectively funding the wallet with fiat dollars ready to spend on crypto. Think paypal and the money transfer agent Simplex) and Ebay as the store (Arculus) you buy from. [**Simplex | Simplex is the fiat/crypto pioneer**](#) they have a whole separate set of verification rules policies and hoops to jump through, which can be affected by state, province, your local bank policy.

Please remember when you upload ID verification – please use no filters on pictures, they may iron out those wrinkles but the software will know and reject it , no cropping or editing of the pictures just send the complete picture otherwise they may and do reject it.

Funny story – after giving out so much advice over the last few weeks I had to login and reactivate my crypto account and re verify myself on my account with id for KYC – and I swear if a prize for the worst selfie ever was

given I would have won – I think I was in chat until about 3am (UK) the night before and wow I looked like I slept on a bench, and it just shows every wrinkle in the high definition picture needed eeeekkk , so I decided its not a fashion show or a tinder profile so just took the thing and yes it was accepted and all set up. Now that picture was definitely a swipe “left for no” type picture... the point is, do not be self conscious just get it done, anyway I digress back to work david answer the question...oops

Some companies specify no scans only pictures taken with camera or phone camera otherwise they will reject it. Sometimes the picture is not clear enough to be read so it fails. Sometimes you blink or its poor lighting and it fails, sometimes the date on utility bill is not within the specified period – usually last 90 days and it fails, sometimes you bank will not authorize because they have a no crypto policy and will stop you on ramping to anyone they see as unsuitable (and this does happen) and of course again it fails. So, in these cases the on ramping companies like Simplex use a variety of ways to verify you, set you up and make sure you are who you are. You may have to write on a piece of paper a word or phrase sign and date it and hold that in the shot whilst taking a selfie, they may want emails or 2fa/3fa the list goes on and on but its all for your security. See [Why did my verification fail? – Simplex](#) and [What if I can't record a video selfie verification? – Simplex](#)

the big brokers listed above are much better at this and it's a smoother experience IMHO.

I suspect and this is my personal opinion, this temp block is because the card issuer in conjunction with your local bank visa-master etc have a chargeback policy, think of buying a bar of gold with your visa card , once you leave the store its gone, the card company must carry the risk and cannot chargeback the seller, well that may apply here with crypto assets , and the on ramping company need to make double sure, also if you have great credit and spending power the risk goes up for the counterparty, you can now (using the gold example) go in and buy six gold bars and leave , do you see what I mean ?

I would suggest it is nothing to worry about, its not you , and you are just being slowed down and double checked and not blocked. Please follow the account advice given by Arculus. If you live in the continental USA and your ID and banking all checks out, you will be up and running in no time.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 32:

I have linked my Capital One checking account to Coinbase Pro and have been placing some small purchases as practice. Each time, I'm told that I have to wait 14 days to move my purchased coins to my Arculus wallet. I'm guessing that's because of my funding account (Capital One). Would using Paypal be a safer and quicker option to use to purchase my BTC on Coinbase Pro? I'm trying to avoid the 14 day wait period if possible. Thanks for your help.

REPLY FROM Bulldog:

Thank you for the question. Well done you nearly all set up.

I must say in my opinion it is normal for new account cash out (withdrawals of coins or cash) to be slowed down at the beginning. I think this could be because of any possible counterparty claim against your Capital One funding via chargeback on your card and account. Another reason could be during periods of high market volatility with so much being moved around coin liquidity is low and they just prioritize the "pay by card" pooled players first, otherwise network fees for smaller blocks would be high, but that is just my theory. Its not just new accounts that get slowed down BTW, random checks, new device logins, the odd forgotten password login attempt, all add or decrease risk, and can prompt a new, or updated set of KYC docs being required.

Sometimes you get an email saying something like, "do you authorise this transaction/ account change made on xyz day for this amount" and even though it's a pain, (check these genuine emails do not get put into -junk mail btw), they are sent to make sure your account, your funds, are super safe. When you follow the instructions and say "yes" your transaction snaps into place. Only you know when you have "traded" or "changed email address etc" so use a little caution, don't click on everything (as you will get junk mail from scammers also) but it's still a good system.

You make a good point about PayPal – they do already know you-so less risk, If you have a small amount and can do a PayPal purchase try it, I have only ever used PayPal to offramp money back into a UK bank account a couple of times. I also fund inward to Coinbase etc via my bank the same as you.

Another possible reason is banking compliance and regulatory checks, all being done in the background on a new account , please see this article [**How long does a sell or cashout \(withdrawal\) take to complete? | Coinbase Help**](#) and here [**Why is my cryptocurrency send delayed? | Coinbase Help**](#)

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 33:

I missed this but where did the term sullivans sliver come from and the 1.1 % come [from.is](#) this from the settlement price. Ythank you 4 your help. Jeshua is LORD

REPLY FROM Bulldog:

Thank you for the question. Ok can I be honest I am a little surprised at this question even being asked, but I suppose I need to treat the question with a balanced perspective, and I have been asked a valid question, so I will do my best for you.

I hope I can explain this in a way that articulates the gravity felt in the words received. In writing this I feel I need to be respectful to Alexander, and his entire family, who have given so much to help us all, so let me begin as I write this on Sunday 19th father's day, the irony is not lost on me. My understanding of this is Alexander, upon his return to chat following his very nasty broken leg, and stay in hospital, shared with the group the very moving and heartfelt stories of his son Sullivan who passed a few years ago. It was a beautiful message he got from his dead son, it seriously brought tears to my eyes reading the posts, a man praying to Christ Yahushua and seeing a vision of His son who (clarified the formula for BTC preservation of wealth) -Wow, not a huge purchase, not a mountain of Bitcoin but a "Sliver", a small 1.111% sliver, and in honour to his dead son "Sullivan" – it was named by Alexander as "a Sullivan Sliver" . What an honour.

you can find the posts in chat and newsletter from 13 -18 june 2022 example links are:

[**JUNE 13, 2022 - CHAT NOTES & ARTICLES #2**](#) and

[**JUNE 14, 2022 - CHAT NOTES & ARTICLES #2**](#) and

[**JUNE 15, 2022 - CHAT NOTES & ARTICLES #1-updated**](#) and

JUNE 18, 2022 - CHAT NOTES & ARTICLES #1

So Please remember When it comes to buying BTC we now have new updated guidance and advice very kindly shared by Alexander on 14june22 to buy 1.111% of settlement into BTC -Bitcoin ASAP. BTC (1.111%)/ZW\$ (100%)/TDP (101.11%)

My understanding is -its no longer explained as ZW\$/BTC/TDP it is now BTC/ZW\$/TDP – lower to higher vibrational understanding – So we must always be fluid in our thinking as new and updated ideas and guidance are provided.

Can I just say I always try (sometimes fail) to check names and spellings and with Christ name I spell as Christ Yahushua – words are so important and keeping an eye on that spelling is a good practice I must keep up. I know we all have had to learn to spell this correctly – (and I must apologize as I use a UK spell checker, so some words are different in my posts)

Oh, I am in full schoolteacher mode today – please forgive me, I just want you to have the information, to be able to freely search, and use the full extent of the HAS chat site to its full potential, so can I please direct you to the excellent search facility shown on the chat page – it's a blue banner (on my Pc screen anyway) and it says

++++ home - list all users - Search - User Details - Calendar - Recent Posts
+++++

a link for this is here - [.activeboard.com/p/search/](https://activeboard.com/p/search/) and if you click on advanced you can search , lookup , research , and find anything you need , it expands your experience , knowledge and shows how much hard work has been put in by Showme , and all the mods .

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 34:

How do we contact OTC desk to purchase large amounts of Bitcoin? What is the working link?

REPLY FROM BULLDOG:

Thank you for the question. Once you are liquid , you can just choose one to open a simple account with . The previous post #1 explains the theory and an example of doing this here - [**"BULLDOG'S CRYPTO POUND" - QUESTION & ANSWER #1**](#) much excellent advise can be found in the forum under crypto – a link is here [**CRYPTO - Human Angel Services \(activeboard.com\)**](#) and a thread has been created showing OTC options [**OTC Crypto Questions & Info**](#) My personal advice is -any of the big exchanges have OTC desks , they are just bigger trade brokers so names like Kracken – Gemeni – Coinbase – Binance –Caleb , these all trade crypto (called exchanges) and all have OTC desks when you are ready.

[**OTC Bitcoin and Crypto Trading Exchange | Kraken**](#)

[**Introducing Gemini Clearing™ | Gemini**](#)

[**Coinbase Prime FAQs | Coinbase Help**](#)

[**Bitcoin OTC | Crypto OTC | Altcoin Trading | Binance Trading**](#)

[**Caleb and Brown - Your Cryptocurrency Brokerage**](#)

My question to you is this - are you ready yet for OTC?

Do you have your Arculus (in the mainland USA) or Ledger / Trezor (Cold storage device wallet) for all other Angels. And do you have it set up? – it's no good in the box.

Have you setup a hot wallet account with an exchange? – maybe one of the above names?

Have you completed your first Know your customer KYC – id upload and, security pictures sending – have you provided your proof of address and got this approved?

Have you logged in to your new standard Crypto (hot) exchange wallet all setup (as above) and linked it to your checking account and purchased your first small \$10 or \$20 worth of BTC?

Have you made a transfer out of the (hot account wallet) and sent to yourself at your (cold) storage wallet?

Have you done another \$10 of BTC and this time used the QR code to capture the send to address and made the transfer to your (cold) storage device?

Have you checked your (cold) storage wallet and can you see the \$20 worth of BTC purchased above in the 2 pieces – is it all safe and sound?

Well then you are a star – your ready – you passed - and when God reveals the blessing to you, your off and running.

Pick your OTC of choice – maybe the trading company you used for your \$10 tests – it's just an upgrade, maybe pick another - A bigger list you can search by country for worldwide angels is here [Blockdata | List of 'OTC' companies](#)

but keep it simple, use the biggest players - in my humble opinion.

So Please remember When it comes to buying BTC we now have new updated guidance and advice very kindly shared by Alexander on 14june22 to buy 1.111% of settlement into BTC -Bitcoin ASAP. BTC
(1.111%)/ZW\$ (100%)/TDP (101.11%)

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 35:

I got a proton email. I've got an arculus card on it's way. But for coinbase it keeps wanting to verify my account. It keeps sending me verification codes (4 so far) I took pics of my ID & card. Like it asked. I took the protective screen off and did my fingerprint but it only goes up to 50%. Then it goes and jumps back to a re-enter for a new account screen. I've maxed out my number of tries for today. Help!!!

REPLY FROM BULLDOG:

Thank you for the question. Ok proton email – not sure if using a swiss email is causing any problems – do you use this for your online banking? I would use the same email address you use for your online banking.

Now you have Arculus on its way perfect.

You are stuck on account verification for a Bitcoin exchange – welcome to the new world, when I first did this a few years ago, it took me ages to realise you must not crop, edit – trim – apply any filters to your identification pictures or proof of address. You cannot even scan documents on the pc for some of these exchanges.

Fingerprint is not normally needed on a Coinbase account at entry level, why complicate things? 2fa is a text message to your phone to verify -with them sending a code when you log in – and make a transfer - that should be enough. Just to get you set up and buying \$10 test pieces

Coinbase and other exchanges have layer upon layer of security – and these only kick in once you start trading big numbers or want to remove coins and close positions from the platform. (for your safety)

I have found a few links and a video which may be of help in solving your problem and getting you set up.

ANGEL QUESTION 36:

What are the advantages of the Trezor Model T over Model One to warrant the difference in price?

REPLY FROM BULLDOG:

Thank you for the question. Let's take a look at this together shall we.

Trezor – great choice see <https://trezor.io/> Remember no ebay buys – always use the Official store – and never give out your seed words to anyone – ever.

They have two flavours of device being -

Trezor Model One -

Connectivity- Micro USB connector for connecting to the computer or mobile phone.

Screen - Bright OLED - 128x64 pixels. Enough to hold six lines of text.

Dimensions & Weight of the device: Size: 60mm x 30mm x 6mm (2.4in x 1.2in x 0.2in) Weight: 12 g (0.42 oz)

Supported operating systems -

Trezor devices currently support all major computer operating systems: Windows (version 10 or newer), MacOS (version 10.11 and higher), Linux. On mobile devices, Android is supported. iOS and Windows Phone are not (yet) supported. ChromeOS is not yet officially supported, but it should work via Google's WebUSB.

Trezor Model One supports more than 1000 coins

Trezor Model T - flagship colour screen model

Connectivity - USB-C connector for connecting to the computer or mobile phone.

Screen - Bright colour LCD - 240x240 pixels

Dimension & Weight of the package Size: 64 mm x 39 mm x 10 mm (2.52 in x 1.54 in x 0.39 in) Weight: 96 g (3.39 oz)

Supported operating systems -

Trezor devices currently support all major computer operating systems: Windows (version 10 or newer), MacOS (version 10.11 and higher), Linux. On mobile devices, Android is supported. iOS and Windows Phone are not (yet) supported. ChromeOS is not yet officially supported, but it should work via Google's WebUSB.

Trezor Model T supports more than 1200 coins.

Optional extras are various and include -covers, lanyards – and some extra USB leads for connectivity - shown below:

Cable for Android phones

Micro-USB (male) to micro-USB (male) OTG cable with a right-angled connector. Connect your Trezor Model One directly to your Android phone and access your wallet anywhere. Length: 20 cm / 7.8 inches.

Extended USB-C Cable

An extra-long Type-A (male) to Type-C (male) cable for convenient connection of your Trezor Model T to a computer. Length: 1.8 m / 5.9 foot.

USB-C to USB-C Cable

USB Type-C (male) to USB Type-C (male) cable. Connect your Trezor Model T to an Android phone or other devices. Length: 20 cm / 7.8 inches.

So, you have the information now to make your choice, Keep those Bitcoins safe and sound – and the cost of each does not really matter now does it, when its post blessing?

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 37:

Curious on your comments on Metamask for (on-line web3) wallet (for those outside USA) and the ETH features that currently are not available for btc ie smart contracts

REPLY FROM BULLDOG:

Thank you for the question. Ok as you probably can see from the updated changes to some of the Posts we have a re-focus and spotlight on Bitcoin BTC - given our new Bitcoin guidance. That's where our focus needs to be IMHO. Obviously Hundreds of wallets, addons, extra security features, can be installed by users, please keep the eyes on the prize.

Metamask for those who have to know is a secure browser addon - The crypto wallet for Defi, Web3 Dapps and NFTs | MetaMask and my personal opinion you do not need this, it will add a layer of complexity and confusion to your learning process. we are not investing in Cryptos , no NFT , no Defi tokens , no Alt coins , no Eth, no complexity , no smart contracts, no coin staking, no loan coin liquidity pools, just an easy simple 1.111% Sullivan Sliver of Bitcoin BTC at minimum to protect your future settlement values. Bitcoin is not Crypto its on its own, unique asset class, distributed ledger technology DLT and Blockchain is the future.

Again advice is to buy a small 1.111% Sullivan Sliver of Bitcoin BTC is all you need to start based on your settlement total, buy it move it to cold storage Hardware wallet job done. Want more Blockchain buy another slither. Arculus / Ledger hardware is cold – offline – Vaulted storage – world class. I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 38:

Hi, I'm new to Bitcoin and don't understand much.I purchased for a few hundred \$ some Bitcoin and some Ethereum through Venmo.How save my purchases are?Can I keep buyingBitcoin and Ethereum through Venmo in the future also? Thank You Judit

REPLY FROM BULLDOG:

Thank you for the question. Let's take a look and see Ok you are using a app called Venmo (for those unfamiliar) it's an American mobile payment service founded in 2009 and owned by PayPal since 2012. Venmo was aimed at

friends and family who wish to split bills, e.g., for movies, dinner, rent, or event tickets.

Ok my opinion is this is not my preferred way for any training – as it bypasses the experience creating the setup KYC uploads of ID and other stuff needed in setting up a Exchange account, but as long as you can purchase BTC bitcoin only in small test \$10 amounts, it's still a wallet – does it have a bitcoin public facing address, each asset has a QR code for your use. So, in theory you can do the wallet to wallet transfer which is a much needed part of your training. You can send these small amounts to another hot wallet or an exchange wallet or the preferred way is into your Cold storage wallet Arculus or Ledger. No need to spend hundreds of dollars, no need to spend on Ethereum or other assets apart from \$10 training. When you have it in your Cold storage practice sending it back to your hot wallet and do it all over if you like – practice like a pro.

Then when you are liquid after the blessing get setup for OTC bulk trade and they can send the BTC Bitcoin into your Cold wallet direct.

Want more Blockchain buy another slither – we are not investing in Cryptos, no NFT, no Defi tokens, no Alt coins, no Eth, no complexity, just a easy simple 1.111% Sullivan Sliver of Bitcoin BTC at minimum to protect your future settlement values.

I cannot see on the Venmo website where you do BTC transfers just buys and sells – its unclear if you can swap either, if you cannot transfer out please start again with a crypto exchange basic account Coinbase Kraken Gemini etc and practice with \$10 BTC only and transfers to cold storage until you are ready. Keep sending the same \$10 or \$20 back over no need to spend \$100 `s.

I'm sorry but using a bill splitting app is not the best form of onboarding or training, but it's a great future idea for mass adoption in the fullness of time. See website here - [Crypto on Venmo](#)

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

ANGEL QUESTION 39:

Hi, I'm new

Bulldog: Should I download these two first Coinbase bitcoin& Etrh and Coin base Pro first or should I buy The Arculus card first, when should I buy bitcoin for this account. Thanks

REPLY FROM BULLDOG:

Thank you for the question. From this writer's perspective it looks like you are taking the first steps into a new area for you BTC Bitcoin and want to undertake your setup and training ready for the blessing. That is great news, okay shall we look at the steps together to get you all set up. Nice and slow ... No rush.

Let's use the example of baking / cooking and shopping to explain this - you need to buy - transport- and store the ingredients for a special meal. And before you try out a new recipe you need to do small test batch first, only spending say \$10 no big spend, just testing, you need to buy storage (a new refrigerator) and get a suitable basket (wallet) for transport (cell phone), sound good so far ?

The ingredients are BTC Bitcoins, and you buy those at special store (called a Crypto/Bitcoin exchange) examples are Coinbase - Kraken- Gemini. So, you will need to set up an account at the (bitcoin) store of your choice, and link your bank account to allow you to purchase small amounts of BTC Bitcoin. You will need to facilitate this on a portable/mobile device i.e., a cell phone or tablet of compatible standing to allow this. For non-mainland USA other solutions including PC are available to be used.

Firstly, you need a cell phone ready to install the apps (that's what computer programs on phones are called) 2 types being Android and Apple IOS.

my advice is to make sure you are happy you can hold it and it feels and looks ok for your needs, you may not need to buy the newest one with all the camera stuff and you may end up buying less features, but it should be a new 2021/2 model and it will be just right for you. your cell phone needs NFC or (Near field communication) essential for Arculus , your cell phone either apple or android must be in this group - Android version 8.1 and later, and a phone that supports NFC. For Apple iOS, - iOS version 10.0 and later, but only iPhone 7 , and a phone that supports NFC.

Now you need Arculus a cold storage device (hardware cold wallet) think of this as a secure vaulted cold storage - (Refrigerator -to keep that Bitcoin goodness fresh) , its hardware and you have to set it up. For mainland USA Angels Arculus is an Excellent choice and Ledger/Trezor for other regions, all

these are metallic cards / plastic metal devices and just like buying a refrigerator for home you need to make sure it fits – check your device minimum requirements and make sure you can run the app on your mobile device to control it. Never buy these from eBay always from the official store and always new and never ever give out your recovery seed words 12/24 to anyone ever.

Fun fact: any storage device that carries BTC Bitcoin or any other Crypto asset is called a wallet, and like any “men’s leather pocket wallet” it has compartments it’s the same for your CRYPTO wallets, it has a BTC Bitcoin wallet address within the overall wallet and that is your mailing address in effect. You keep the keys private, but you give out the BTC wallet address to receive BTC Bitcoin. Please Do not mix them up, you cannot send BTC to ETH, only BTC to BTC addresses.

Now its time for a Bitcoin Store (exchange setup) and you will get yourself setup on the exchange with your new account you need to pass (KYC) know your customer checks first, and yes you will have to take selfies on your cell phone as proof of ID and you will probably have to reply to emails verifying your ID , and yes you will have to take ID Photographs of driving licences and passports , and yes you will probably get verification emails (always check spam email folder for setup emails at the beginning) and yes all this is a pain and yes its awkward but it’s not complicated it’s just new. Do not crop edit or use filters on the id pictures of they will probably be rejected. In the old banking world, you would just go into your bank with your passport / driving licence and copy payslips to open your account, now in the new digital QFS age its all online, all digital, all in the cloud and super easy, it’s just new that’s all.

Now more about the Bitcoin store (the exchange of your choice – kraken – Coinbase – Gemini etc) This is called a (software wallet- it is also a Hot wallet because it has no hardware) this exchange APP (the program you downloaded in setup above) is special, as it allows you to buy BTC Bitcoins from the app, so it’s like a basket with built in checkout – you buy your Bitcoins BTC at the store and can pay for them all in one. You can then transport them around on your device and then, just like grocery shopping, you can transfer them to the Refrigerator (cold storage Arculus) when you are ready.

And just like packing your grocery bags you don’t put your bread and buns on the bottom of your basket and place the milk and heavy tins on top (and yes us men have all done that at some stage during speed packing - but hey we all learnt the hard way usually when we were given a squished up

sandwich shape next day)– it's the same with storing BTC Bitcoins – they have a unique wallet address (public) within the Hot or Cold wallet to put them and keep them safe and every address is unique so you don't get confused.

Other types of baskets are available for carrying around BTC Bitcoins and other crypto assets and these are just (hot wallets) no built-in payment account checkout, I have mentioned in previous posts Exodus as one of these and most exchanges do have a wallet only app – true (hot wallet) but we need to practice buying at the store, so we need an exchange app account.

You can now go to your app on your cell phone for your Bitcoin store (use the exchange of your choice) and purchase a small \$10 amount.

You can then transfer that amount from your app (which is a hot wallet after all) to your cold storage Arculus (your refrigerator) for safe keeping – this wallet-to-wallet transfer is the same in principle as the example here –

[How To Do A Wallet to Wallet Transfer - Human Angel Services \(activeboard.com\)](#)

just replace Exodus in the example with Arculus if that is your cold storage device in the USA. A detailed Arculus - example was shared by Godfather in his excellent FYI post here -

[Godfather's FYI - Wednesday, June 22, 2022 - Human Angel Services \(activeboard.com\)](#)

You have now successfully selected your hardware – you have bought and setup your storage and you have test purchased and put away safe a small \$10 test amount. Well done, I am proud of you. No need to buy anything else apart from BTC Bitcoin You have completed training concepts.

Go slow – take your time – you will not miss out, if it takes you longer it takes longer sobeit.

Now OTC is the next step but only after you have mastered the above – baby steps first, so when you are liquid and have been blessed approach a OTC broker, it does not have to be the same one you did the test purchase with. Let me reassure you OTC is so easy , think of the shopping and kitchen example above , you needed a small \$10 order and you went to the store yourself, well OTC is like placing the biggest catering order for the Superbowl

afterparty , HUUUGGEEEE, so you now go to a Bitcoin Wholesaler, and you can order literally truck loads of BTC Bitcoin and they pick, pack sort, and deliver to your door , they will even place into your secure refrigerator for you (your Cold storage Arculus all safe and sound) no need to buy in pieces no need to sit at the store all day – your OTC broker will walk you through, take your order – take your payment and deliver to you. Now that is so easy it hurts ... am I right ?

I hope my training example today of cooking/ shopping is shown in a relatable manner, that has not confused everyone more, when you get the concepts of BTC Bitcoin, Wallets and transfers, well the penny just drops so to speak, and you just "Get it ".

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

UPDATE JULY 9, 2022

ANGEL QUESTION 40:

Firstly Bulldog, my hats off to you, great job answering all these questions. Like it says in the subject above, I own XRP, Stellar Lumens (XLM), Cardano and some more other than bitcoin since June of 2021 spread among 4 exchanges. I've been looking at Arculus per Alexander's original recommendation but it doesn't support my other cryptos. Do you know if any of your top wallets support other cryptos? Again, thank you for all your efforts in helping us Angels. Sincerely,

REPLY FROM BULLDOG:

Thank you for the question. Please, no praise needed for me seriously – it's all Christs work putting us all together, here at this time, me well, nothing special here, it's just my small effort stepping up to help, and in time Showme will have a shiny new HAS-HQ all up and running, employing some real Bitcoin experts (Canada has some of the best Blockchain minds in the world) and I can just get on with my Safe Havens. Anyway, if the expert gets stuck they can always send me a PM ...LOL , now you see, with this sort of attitude and terrible humour, no wonder I'm on a remote Scottish island, and only get let out once a day to answer the Bitcoin Q+As.

Enough brevity, back to your question about your private crypto portfolio and how to store them. Well, my answer is, this is not the forum for that advice. Sorry but your personal crypto portfolio is not of any significance in

the bigger picture here is it really, millions if not billions in settlements need hedging, and the only question we talk about is how to hold a few penny stock picks cryptos? Sorry if that seems hard but we must stay on point. We must stay focused on preserving future values by buying "Sullivan slivers of 1.111% of settlement in BTC, at least one, and more if you can feel into it.

The above notwithstanding – I am also surprised as your question indicates an understanding of crypto markets and varied investing. I suspect you already know not all asset classes can be held on a single Hardware wallet due to the private blockchains, the diversified main-nets, and the developmental nature and issuance for tokens in your portfolio. I suspect, you already know, private keys must be held to protect your wallets, both software and hardware integrity.

Top Tip: maybe it would be a good idea to keep your private investment pool of tokens - separate from your settlement hedge of BTC Bitcoin.

That said and for Academic purposes only for the group, and to aid you in securing the purchases you have made in your private portfolio, bellow are links to the ample amounts of assets each type of major Hardware cold storage wallet will Hold. You will need to mix and match until all that can be offloaded from exchanges are done, but the information is listed to help you.

[**Arculus - Which cryptocurrencies am I able to hold in the Arculus Wallet?**](#)

[**LEDGER - Ledger Supported Coins & Tokens | Ledger**](#)

[**Trezor - Trezor Hardware Wallet- supported coins tokens**](#)

[**BCVault - Multi Cryptocurrency Wallet | BC Vault | List Of Currencies**](#)

Note to the group in general - Just because a hardware wallet can hold more types of tokens and coins does not make it a better wallet.

My advice stay focused on BTC Bitcoin as you current only hedge of settlement money, remember we are not investing in Cryptos, no NFT, no Defi tokens, no Alt coins, no Eth, no complexity , no smart contracts, no coin staking, no loan coin liquidity pools, just an easy simple 1.111% Sullivan Sliver of Bitcoin BTC at minimum to protect your future settlement values. Bitcoin is not Crypto it's on its own, unique asset class, distributed ledger

technology DLT and Blockchain is the future, it's the start of QFS in my perspective of understanding. Buy it, move it to a cold storage Hardware wallet job done.

Arculus / Ledger / Trezor hardware is cold – offline – Vaulted storage – world class.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION #41

1. Where to purchase bitcoin.
2. Can I get defrauded on my purchase? if so how.
3. "Cold Wallet" is for storing the bitcoin and "Hot Wallet" is for purchasing items with bitcoin, correct?
4. Can I and should I get a cold and hot wallet when I purchase bitcoin?
5. Do I have to purchase those wallets, if so abouts what are the costs?
6. Do I get these wallets at the same place that I buy the bitcoin?, if not where can I buy the wallets?

REPLY FROM Bulldog:

Thank you for the question. Before we get into your questions, and in part answer to the many PMs I get sent from various people regarding Bitcoin and setup stuff, may I share a story with you all first.

My name is david and I do not like being called dave very much, but my grandmother Florence or "Nanny Flo" would have a special name for me "daveyboy" and she would bestow many pearls of wisdom on the young impressionable 6-year-old david. And if you have ever taken a small child on a new trip , a first train journey , a first visit to the market, you will undoubtedly get a constant steam of questions – "How does this work " "Why is this " "Where is that" "How much is this " "Are we there yet " endless and relentless is the imagination of the young mind , and every now and then, after an exhaustive list of Questions were lovingly answered , my gran knew I was not paying attention or was just asking for the sake of

being seen – She would turn to me and say – “ daveyboy, ask too many silly questions and you will get a silly answer” she was teaching me discernment , to listen more and speak less, to read more and think more, especially before talking, to just experience and go with the flow, to just enjoy the passion of it all. I can tell you bits of this did sink in. Thank you both Nanny Flo and my mum (they both passed many years ago now -love you, miss you all loads) Honestly, I am still a work in progress.

My answer then to so many fear-based questions and for those who are just not paying attention in true “Nanny Flo” style is -

“supercalifragilisticexpialidocious”

At this stage of the HAS journey I feel those paying attention will not be knocked of the beam and distracted – we will not be bewildered, befuddled and confused, we have paid attention , learnt and take every step forward – with what was that song Showme used to play on the calls “Into the Unknown” together we will learn new stuff – find a way, adapt and fulfil our mission of Helping people help people.

I find it hard to believe that after someone paying attention has read the last say 90 days of Alexanders chats and posts- thousands and thousands of words and countless articles [**CHAT NOTES & ARTICLES**](#), and if that person has looked at hundreds and hundreds of crypto and blockchain articles posted in the forum by people like our very own Brother Angel Yambuta please see [**CRYPTO - Human Angel Services**](#) – that the countless examples and screengrabs and walkthroughs by myself - and talented Angels like [**Godfather Godfather's FYI - Wednesday, June 22, 2022**](#), and read the some 40 extensive Q+A sessions, watched some of the many hundreds of helps videos provided - we are still at the same position for questions.

Now with all that said I know people are struggling with the concepts and the newness of the BTC Bitcoin thing, I get it, I really do, it's only ever easy if you get it.

Please consider this example - Sometimes even the most non tech Octogenarian, with no email and computer smarts, always seems to have a way of picking up the concepts of his new satellite navigation on his boat, mainly because that is his passion, it's what drives him, and that attraction of like energy is what propels the learning. The focus of attention and energy. He just loves to fish, being on the river is his life, boats are his thing, and guess what his new boat is packed with high-tech space-age

gizmos, and he learns them eagerly, showing them off to all who come onboard. He reads the articles looks at the user guide, watches the videos, does the research, plays and explores. but at home just cannot use the VCR..... now does this sound familiar with someone you have met?

So, please let's lose the fear of the unknown – let go of that can't do and grab a big bag of can do, will do, and together leap into a new world. And for my part I promise I will do shorter answers and always find new ways to explain and explore different perspectives for better answers, so that everyone willing to give this a chance, gets the training and confidence with BTC Bitcoin going forward. We have lots and lots of help already printed here at HAS, please let me guide you to some you may find useful.

Your questions answered finally in a bullet point easy to read style, maybe this will help today.

Q1. Where to purchase bitcoin- A = at the bitcoin store called "Exchanges" , you buy lots of Bitcoin at a Bitcoin Warehouse using a private broker its called "OTC trading" please see answer # 39 – ["BULLDOG'S POUND" Q&A #39](#) and older post ["BULLDOG'S POUND" Q&A#29"](#)

Q2. Can I get defrauded on my purchase?- A = yes you can get defrauded in almost every aspect of your life – you need to take sensible precautions and never live in a fearful state – God is with us – see # 15 ["BULLDOG'S POUND" - Q&A #15](#)

Q3. Part1 "Cold Wallet" is for storing the bitcoin – A= yes, any wallet hot or cold can hold bitcoin but the long-term safe solution is to store in a hardware cold wallet just like a vault, these wallets are ARCULUS/ LEDGER/TREZOR they have a piece of hardware – plastic or metal card or stick gizmo. See answer # 28 – ["BULLDOG'S POUND" Q&A #28](#)

Q3 Part 2 and "Hot Wallet" is for purchasing items with bitcoin, correct? A=Not exactly, but you are on the right track, wallets are wallets, The problem is Arculus is unique as its so portable, most before this were Pc based so were leave at home type hardware wallets, and the Hot or "On your mobile device portable Hot wallet" was indeed used for making purchases or transfers. In time this will be as easy as paying with Visa card at the store, in some ways Arculus is that today. I would explain Hot wallets as portable, and cold storage Hardware wallets as not. See answer # 39 – ["BULLDOG'S POUND" Q&A #39](#)

Q4. Can I and should I get a cold and hot wallet when I purchase bitcoin? –
A= you should do some training – we have been practicing by buy a “Cold storage hardware wallet device” and setting it up, we have been setting up an account at an Exchange of our choice and buying small \$10 amounts which then get put into our free wallet on the app - and then we have been sending this to our cold storage as practice. This has given us hot and cold wallets - please see wallet to wallet training here - [**How To Do A Wallet to Wallet Transfer BTC**](#)

Q5. Do I have to purchase those wallets, if so abouts what are the costs? Software wallets are free, on cell phones they are called apps and are installed. When your set up an exchange account they also use an APP or program on the PC and are free, the setup experience of the new type of financial account we call KYC is new a bit fiddley but not so frightening it cannot be done . Arculus cards are about \$100 +tax - others are similar. buy [**Arculus: The Secure Cold Storage Wallet**](#) only buy from official store please

Q6. Do I get these wallets at the same place that I buy the bitcoin? if not where can I buy the wallets? – see above Ans please

Please also remember when reading older posts, we have new updated guidance now on BTC Bitcoin - advice is to buy a small 1.111% Sullivan Sliver of Bitcoin BTC to start - based on your settlement total, buy it move it to cold storage Hardware wallet job done. Want more Blockchain buy another sliver. Arculus / Ledger hardware is cold – offline – Vaulted storage – world class.

Just a fun footnote – as this has been an indulgent nostalgic look back at the 1970s, and my childhood, please forgive me – I was reminded of watching my fav Tv show as a child “The six-million-dollar man” – yes Lee majors was a legend in my house even before he was the unknown stuntman. I saw they are doing a remake – maybe for 21st century audiences – maybe it should be called the “The Six Bitcoin man ?” ... nonot the same... nope.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 42:

i have more than one arculus cards. do i need to hae multiple phones or will they load on the same one? when i try to load another card it goes to the first one i guess im not quite techy enough yet thanks

REPLY FROM Bulldog:

Thank you for the question. Okay from what I can gather on the Arculus website – because of the unique pairing nature of the Arculus card and the mobile device only one unique seed word setup can happen on each device. Otherwise, you will effectively be doing a restore on the second card cloning the first using your recovery seed words – the same as you would if you damaged the first card, and needed to do a restore/recovery.

Here are some of the help support questions I found online :

[How many wallets can I use with one Arculus Key Card?](#)

Right now, one wallet and one card will work together The Arculus Wallet™ App is currently set up to support a single card and wallet at a time. A user would have to go through the wallet recovery process to switch from one wallet to another. How many wallets can I use with one Arculus Key™ Card? – ARCULUS

Can I Have more than one ARCULUS Key Card associated with the same ARCULUS WALLET™ APP?

<https://support.arculus.co/hc/en-us/articles/4407497758103>

Arculus general support

<https://support.arculus.co/hc/en-us>

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 43:

[Gate.io](#) is out of the U.S. How do you save your crypto currency when a coin says "suspended"? Is it too late to get out of [gate.io](#) if you're in the U.S.?

REPLY FROM Bulldog:

Thank you for the question. For those that do not know [Gate.io](https://gate.io) is a cryptocurrency exchange. It has millions of registered users worldwide – I think they started in 2013. Now the whole crypto market is highly volatile – that is why the guidance is to only buy BTC Bitcoin to hedge your settlement. Please see a post here explaining they seem to have pulled out of the market and have closed accounts [Gate.io](https://gate.io) No Longer Allowing USA and Canadian Users : Cryptocurrency (reddit.com) They informed all customers to verify Residency earlier this year and informed customers with repeated emails and letters withdrawal assets by 20th April 2022 and account closures for those who did not pay attention would happen on 30th April 2022. Many of these smaller USA/CANADA players and overseas exchanges have needed to upgrade regulatory processes or have been unable to replicate the huge market dominance in Asia and the Far East so just closed.

As market volatility increases many more will fail, close up shop and stop trading in non-profitable areas. Coinbase – Kraken, Gemini etc are big USA/Canada Worldwide Exchange players and have been mentioned many times in my Q+A. BTC Bitcoin is a world class reserve asset and not to be compared with penny stock crypto picks on Asia exchanges that will probably all go to zero. So, to answer your question – it may be an account closure if you were notified and did nothing about it. Or it may be a defunct and now worthless crypto stock pick, if nobody is mining that asset it's dead and many, many, will befall this fate as the great shake up occurs. Please put it down to experience – keep your eyes on the prize and focus on BTC Sullivan Silver and safe havens going forward. I hope this is informative and has helped with people's understanding – it's shared with much love..

QUESTION FROM ANGEL #44:

Prepping for release/checklist - First let me say, you've done an awesome job with preparing us for crypto and our new financial undertaking. You are very much appreciated. _____ As we get closer, and I review the dogpound submissions and others, I feel the need to streamline some of my knowledge. I hope asking this is not redundant! I know we've gone over several "to-do's" related to bitcoin ownership and preparing ourselves for BTC/ZW\$/TBD.

*What I'd really love to have is a "checklist"/"walk-thru" if you will, of what we should endeavor to have in place when the time comes and/or actions we should be ready to take soon after. Sometimes the answer to unasked questions can eliminate perceived issues.

REPLY FROM BULLDOG:

Thank you for the question. Firstly, no need to thank me- just seeing everyone getting more experience and confidence just fills me with joy, thank you all for learning this stuff – for some it's not been easy.

Okay so a prepper checklist I like it

Prerequisites:

- You need your cold storage Hardware wallet setup- and you need to know and understand the public facing wallet address for BTC Bitcoin (you will need this to receive BTC Bitcoin)
- You need to have done at least one Wallet to Wallet transfer for a small \$10 test, just so you know what's what with BTC Bitcoin. Simply open an exchange account with Kraken – Coinbase - Gemini etc, basic account for this.

Action- Post Blessing:

- Pick an OTC Broker – does not have to be the same as the \$10 purchase account – and setup your account with all the KYC pictures and copy ID – very similar to opening a Exchange account during the \$10 test purchase.
- Decide how many BTC Bitcoin “Sullivan Slivers” you want to go for – each one is 1.111% of settlement.
- Phone or contact your OTC Broker –
 1. Tell them you have UST account.
 2. Tell them how much BTC Bitcoin you want to buy or total \$ spend.
 3. Tell them you want them to buy even on a falling price.
 4. Give them your BTC Bitcoin public facing wallet address from your cold storage wallet (see above in prerequisites) they need this to send back to you the coins purchased
- you will then be asked to fund your OTC brokerage account, ready for the trades, - use your new UST settlement card/account – no need for any retail banks, or middlemen.
- They will then (probably) swap you into a Stable coin – and hold this on your account, all automated, nothing for you to do, and then using a team of brokers/AI auto execute the trades for you. When done they deliver your purchases to your cold storage device (small test first then the motherload if you ask them)

- You then simply Check all is received and in your cold storage hardware Wallet, (make sure its completed after a few hours and not just pending) job done in protecting your settlement with a BTC Bitcoin hedge.

If you need a ref for each stage - the closest thing to a full walkthrough is here - please see answer # 39 - ["BULLDOG'S POUND"Q&A #39](#)

Time for a glass of wine – and do a little dance go on you earned it ..yippee

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION FROM ANGEL 45:

how many cold wallets? multiple smart phones? I thought Alexander suggested we only keep a max of \$100k initial purchase on each cold wallet. Does that ring a bell to you? If so it will take quite a few cold wallets to do 1.111 %. Do we then have a separate smart phone for each and make multiple smaller purchases? Thanks!!

REPLY FROM BULLDOG:

Thank you for the question. Okay it looks like today is going to be a technical one. Buckle up fellow HASFAM we are going on a wild ride today. Let's take a look at this together shall we – after doing some searching I think you are referring to Alexanders comments made in chat #2 on 8th may - [MAY 8, 2022 - CHAT NOTES & ARTICLES #2](#)

So, this guidance is suggesting you not put more than 50,000 BTC bitcoins which at a hypothetical price of \$20,000 each will be a spend of Us\$2 billion on one cold storage card.

Because the blockchain is transparent – holdings are recorded and can be seen by all, (not names and address) just overview. – so, you want to be in the 10,000 BTC to 100,000 BTC Bitcoin holding range max per Cold storage Hardware wallet, you want this so as not to stand out for your security.

The very kind advice and guidance also went on to say, split up the physical location of your cold wallets for redundancy, and maybe load 150M - 500M per card so that's Us\$150million or 7,500 BTC Bitcoins to a max of Us\$500

million or 25,000 BTC Bitcoins on one card in one location. Sounds like good well thought out advice to me, thank you Alexander.

Ok so while we must not dwell on the number value of settlements – it's not about how much, I just don't see any other way of explaining the splitting and redundant policy without crunching some numbers – so for academic purposes I have outlined 5 scenarios below. Let's see;

Doing some sums:

Example 1-Blessing = 18 million Us\$ and 1 "Sullivan Sliver" is selected at 1.111% so-

BTC to buy is $(\text{Us\$}18\text{million} \times 1.111\%) = 10$ BTC Bitcoins total cost Us\$200,000 at \$20,000 avg BTC price

Example 2- Blessing = 1 billion Us\$ (9 zeros) and 1 "Sullivan Sliver" is selected at 1.111% so-

BTC to buy is $(\text{Us\$}1\text{billion} \times 1.111\%) = 555$ BTC Bitcoins total cost Us\$ 11million at \$20,000 avg BTC price

Example 3- Blessing = 10 billion Us\$ (10 zeros) and 1 "Sullivan Sliver" is selected at 1.111% so-

BTC to buy is $(\text{Us\$}10\text{billion} \times 1.111\%) = 5,555$ BTC Bitcoins total cost Us\$ 111million at \$20,000 avg BTC price

Example 4- Blessing = 100 billion Us\$ (11 zeros) and 1 "Sullivan Sliver" is selected at 1.111% so-

BTC to buy is $(\text{Us\$}100\text{billion} \times 1.111\%) = 55,550$ BTC Bitcoins total cost Us\$ 1billion at \$20,000 avg BTC price

Example 5- Blessing = 1 Trillion Us\$ (12 zeros) and 1 "Sullivan Sliver" is selected at 1.111% so-

BTC to buy is $(\text{Us\$}1\text{trillion} \times 1.111\%) = 555,500$ BTC Bitcoins total cost Us\$ 11 billion at \$20,000 avg BTC price

So from the above – once you are blessed you need to sit down and calculate your numbers – tell no-one, not even anybody in HAS its your private business.

Then work out a policy that works for you – want to keep it simple just fill up your cold storage device you have to the advised top limit of Us\$500 million or 25,000 BTC Bitcoins on one card, all in one safe location. Feel you need to split them for safety get another phone and cold wallet and move half over. Feel the need for more Slivers – then re do your sums.

TOP TIP: My personal advice even for the smallest holder – get two extra phones/hardware wallets and move it all to these and then your day-to-day walkabout cell-phone and cold storage can be called say luke-warm instead of Cold storage, you will have the empty (luke warm) storage and a hot wallet on your device the other two will be switched off secure offline and safely stored. (See you knew all that wallet-to-wallet transfer training would come in handy one day)

I know all this adds another layer of Complexity, and some just want is Easy and simple, and done -Not confident to move it yet ? okay , just keep the single setup hardware cold storage wallet device safe and secure, and do not carry it around with you for security, maybe learn more and spit holdings later, if and when needed.

The only silly example I can give to explain this is imagine sitting with a shoebox filled with \$100 bills in front of you – now you will put some in your purse (hot) and some in your home safe (luke warm) and split the rest and place in a couple of bank safe deposit boxes (Cold). You just have to decide how much, when, and where. No different from your new blessing box full of BTC Bitcoins.

Nobody else can do this for you and make these decisions, all this is just my opinion and guidance and links offered to HAS members – it is your money and therefore your responsibility to handle your affairs. No need to go into a spin and ask loads more questions – this is not the forum or place; you have all the information and best practice guidance – I urge you to just relax be calm ask Christ and guidance will come.

Think about where you are going to store them (BTC Bitcoins) and how you will access them – imagine you are a HAS Whale with huggeeee holdings. I have gamed out an example for dealing with this, and I will share below. Please this is an Academic example using \$20k BTC price and only buying one 1.111% into BTC, don't go into a tailspin but we need the conversation about how we store huge wealth, it can also be an example you can scale down for your exact needs no matter how modest or huge your blessing is, everyone can take something away from this post.

So based on example 5. (above)

Half a million BTC Bitcoins need to be held safely over Us\$100billion ...wow

This will take a while to OTC fill, so you have plenty of time.

With 50,000 BTC per card per location we need 10 sets.

For this example, we will - go

With 25,000 BTC per card per location we need 20 sets.

and 1 "Sullivan Sliver" is selected at 1.111%

a suggested list of:

20 x cold storage devices – can be left in box with all leads etc (no seed words)

20 x phones / tablets / mini laptops (to hold the apps). boxed inc chargers etc

20 x sets of USB connectors if non-Bluetooth or NFC is being used

21 x plastic foam filled waterproof boxes for storage (make sure they fit in a bank vault box of your choice – and hold all the above kit -so work backwards)

20 x metallic crypto seed word storage devices (many types available) or just use the handwritten paper ones – or even laminate the paper ones and keep safe.

Maybe get another extra cold storage device used as luke-warm storage for extra purchases to be kept with you and your walk about cell phone, all the others put into boxes, sim cards out, offline and placed into bank deposit boxes by your estate planning lawyers.

They are cold (offline and air gapped) they are safe (only your lawyer and you can get them) they can't be hacked lost or damaged. The seed words etc are then in a separate box and held at a most secure location for recovery purposes.

All you have to do is pay the storage fees and pay and cell phone contracts if you use phones, and pay your lawyer, these can be left cold until needed, you need to keep track of all the phone logins passwords emails and pin codes along with seed words, so slow and careful setup is needed, its fiddley but hey with this example you are looking after 11 billion us\$ in BTC wealth alone. Need box 1 back – your lawyer gets it security van delivered to you, and security van delivered back to the bank. How easy is that

you have your luke-warm hardware device and hot wallet on your day to to walkabout cell phone and can get on with your life and safe havens.

If you read this and the urge to ask another question pops up , maybe a “What if” or “What about” or “but ” “or what happens if” please re read this , training is over its real world time people, and we must take responsibility stand on our own two feet and make good choices – we have trained for six years , we are ready , have faith in yourself , Christ has faith in us all. But for security no one else can do this for you.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

UPDATE JULY 23, 2022

QUESTION #46:

Subject: Percentages : What was the percentage that Mr A suggested we purchase of each of the 4 crypto’s? Thank You

REPLY FROM Bulldog:

Thank you for the question. Okay Its important to always stay current with the new guidance and advice as things evolve quickly in HAS, and this is what happened here. You refer to an earlier time, in which Alexander did indeed share advice, leaning towards a small basket of some 4 or so Crypto assets, to be purchased post blessing. This has now been made obsolete and is no longer the guidance, so I will post no link to this here. Buying only BTC Bitcoin has replaced this, using The Sullivan Sliver percentage, it is easy to understand, Simple to do, and clear in its Objective, and this should currently be our strategic hedge asset, held to protect our blessing amount. Please see [**"BULLDOG'S POUND" QUESTION & ANSWER #33**](#) for details

of Sullivan Sliver in detail. BTC Bitcoin is not Crypto per se, and we should treat it as such as a unique asset class.

So Please remember When it comes to buying BTC Bitcoin we now have new updated guidance and advice very kindly shared by Alexander on 14june22 to put 1.111% minimum of settlement into BTC -Bitcoin only ASAP.

46

Want more BTC Bitcoin goodness buy another Sliver -you can buy as many Slivers as you want btw: see below

**No of
Sullivan %
Slivers Blessing**

1 =	1.111%
2 =	2.222%
3 =	3.333%
4 =	4.444%
5 =	5.555%
6 =	6.666%
7 =	7.777%
8 =	8.888%
9 =	9.999%
10=	11.110%
11=	12.221%
12=	13.332%
13=	14.443%
14=	15.554%
15=	16.665%
16=	17.776%
17=	18.887%
18=	19.998%
19=	21.109%
20=	22.220%
21=	23.331%
22=	24.442%
23=	25.553%
24=	26.664%
25=	27.775%
26=	28.886%
27=	29.997%

My understanding is -it's no longer explained as ZW\$/BTC/TDP it is now BTC/ ZW\$/TDP – So we must always be fluid in our thinking as new and updated ideas and guidance are provided.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 47:

Subject: how do I sync phone & physical card : So I have BTC on my Arculus card that I can see in my Arculus phone wallet app, but I see no way to transfer that info to the physical Arculus card. I tried looking at FAQs and asking in Arculus web search, but nothing comes up for this. Shouldn't I update the physical card with my app info? How do I check what is actually on the physical card? Color me confused. Lol

REPLY FROM Bulldog:

Thank you for the question. Okay shall we take a look at this together. I think after reading and taking a good look at the Arculus help site and rereading this again- I can see why people struggle with the concept of not understanding how info gets from the phone app to the physical card.

I will try and explain my understanding and perspective of this, with a motorway or (freeway road) example.

Now we all know BTC Bitcoin is a blockchain asset using DLT Distributed ledger technology, and this blockchain can be visualized as a big Freeway running above your head. Now to get your data – i.e., the BTC Bitcoin transactions on and off the freeway we first need an on-ramp or a private access way to send data – well that is your Arculus App installed on your device (phone/tablet etc), it's all controlled by the APP not the card. And the keys to the gate (private keys) is the Arculus card itself, with all its state-of-the-art security and technology. Same applies if you are using Ledger or Trezor btw, these are all hardware private key storage devices only.

So back to the Blockchain freeway example, on this freeway each exit, or off-ramp has a unique address, and that address is your (public facing wallet address) so when you first setup your app for your card you create a unique and one-off address to the blockchain freeway, that address is your offramp "your exit" and its unique to you. If anybody "drives down" this off-ramp or exit, you will effectively receive BTC Bitcoin inwards into your wallet, you

cannot stop it. In the same way you cannot stop anyone sending you a letter to your postal address. Your off-ramp address is public facing just like your mailing address and zip code at home – not a secret. Behind the scenes the incoming BTC Bitcoin has been placed on the Blockchain under your Public wallet address and its here the data is stored not on your card. The blockchain holds your data. Your “App” for your Cold Storage Hardware Wallet of choice, can see and decrypt your on/Off-ramp access, so when connected to the internet it will update your balances. So that’s inward coins via the exit or off-ramp, but what about the on-ramp and sending coins out?

Your Arculus card (or others) guards the on-ramp stopping any outward traffic being sent onto the Blockchain freeway, and ultimately to be off-ramped at another address – (i.e. a wallet to wallet transfer), it stands guard and blocks the onramp in front of your BTC Bitcoins - with its high security private keys (held inside) not the 12/24 seed word recovery phrases , that’s just for you to recreate the app/card link if needed. The private keys to unlock your wallet are stored and held in your hardware wallet. So, when you want to send BTC Bitcoin, a tap on the back of the device with your Arculus is the key opening that allows the gate to rise and your BTC to travel on the Blockchain “freeway” to its destination, you and only you can raise this gate and that is what makes it so secure. Now on Ledger/Trezor you may have to enter a pin number instead but it’s the same process.

The card does not have to sync with anything. its not a iPod syncing music from the library on your device, it’s just a KEY, and it only fits one specific lock, one that is created when you set up your “app” for the first time, creating a new set of unique cryptographic wallets, and bonding them with your hardware device of choice, these are then paired for life on that wallet address, giving you a private on/off-ramp to the Blockchain.

The technical “behind the scenes” science is much more complex and is a proprietary technology and a closely guarded secret, but above is my very simplified explanation on how these things work.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 48:

Last couple of weeks, I am needing to earn some funds to live on, till the blessing comes, and I came across a cryptocurrency program to do that. I

found that it is not for those who have a little knowledge about coinbase and Bitcoin (BTC). It can be very dangerous. Q: What is the best way to learn coinbase and all its functions, and BTC and all its functions? I know A wanted us to learn, using small amounts and transfer them, but is there a best source to learn all this. I also want to know how to set our Sullivan Sliver up to earn interest. The small experience I've had the last week or so taught me that it is possible to earn a great deal of funds but very risky! You may have answered these questions, just tell me to refer to your previous posts. Thank You

REPLY FROM Bulldog:

Thank you for the question. Okay let's look at this – you ask about cryptocurrency trading programs, and earning money pre/post blessing, please let me stop you there, with the greatest respect this is not the forum for that advice. No Coinbase day trading strategy no matched pairs etc should be a topic for us here, we do not need to spend the energy of more wealth accumulation – we are abundantly blessed with what we have. And we should take the advice kindly given so far and get ready to receive what will be revealed when the group is ready in good time. In fact, I have been specifically asked not to waiver from our core advice on buying at least “one Sullivan Sliver” @ 1.111% of settlement amount into BTC Bitcoin and it is great advice. IMHO please stay away from algorithmic AI trading get rich quick advice – this is not where I want to focus my attention, I hope you understand, this is highly risky, super leveraged and in a spiralling downward market extremely volatile if not downright dangerous.

I will also not talk about monetising our BTC with any interest/staking at this stage, what is abundantly evident is we need as a group to achieve stage1 first – protecting our blessing with a simple hedge into BTC Bitcoin and leave this in cold storage. My personal perspective here is the world is changing fast, regulation frameworks and laws regarding CBDC and Bitcoin are being formulated and put in place across the world, we will be holding BTC for now, in cold storage, as a hedge of principle only, for some time to come. In the future, sure I can see possibilities for these assets to be used, but for now remember we are buying into a declining price and highly volatile asset class, the price is collapsing, and we are buying it up, best to be safe, slow, and wait until new guidance comes forward.

Ultimately it's your money and this is only advice after all. Now as for your comment about needing money pre blessing – it looks like your prayers are answered with events unfolding, keep those eyes on the prize – what is the saying “Windshield not rear-view mirrors only”

Forgive me if this is not the answer you may have expected, but I know it's the answer that makes sense for this group, with the enormous blessing headed our way. With the huge responsibility bestowed, we need to be focused not distracted, we need self-control, and all our discernment, to keep HHH and never quit.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 49:

Bulldog, Peace and blessings to you! I want your opinion on what I'm sharing below. I was going to post about it, but I keep running into "technical issues." So now I'm thinking perhaps I should get another opinion first ! I know you do your own quick research. *Note: I realize this is a lengthy "question" :) If you see fit, please share it . Thanks. _____

What I want to share with you and the rest of my HASfam is - Don't sleep Cashapp! I see cashapp as an "anti-fiat banking" entity!!:) Cashapp allows me to bank without interference, Participate in all things crypto-buy crypto at my convenience, make wallet-to-wallet transfers,etc. buy and trade stocks and keep a record everything on my smartphone. Also, I can control the ability to use my card with my smartphone, until I decide to use the card again! I definitely plan to incorporate the use of Cashapp for my safehaven. ..

(the very detailed and explanative email has been edited out by Bulldog from this point on purpose- much gratitude for you for sharing with me)

REPLY FROM Bulldog:

Thank you for the question. Okay I have a spring in my step today – Feeling very zen like – but I digress, back to work- in response to your question I will say this is not the right forum now to talk about this, as it takes us off point. The focus from my perspective is securing our settlement values, with at least one "Sullivan Sliver of 1.111% of principle into BTC Bitcoin as a hedge, and getting everyone willing in this group over that line.

Now with that said, in my opinion, you should publish this in the CRYPTO section on HAS – and I am sure Lori will help, or I can help in getting it published and page formatted/setup for all to read. Again, just my opinion this is part of the new wave of apps for cash / BTC that will flood the market

once the CBDC standard and full regulatory policy is decided upon and rolled out. I feel that time is very close. A much bigger discussion in HAS will emerge, probably with HAS new Crypto Expert for the HAS HQ, and everyone including me can learn lots and lots of new stuff. This is very fluid, fast moving area, and for an old tech guy like me very exciting time, especially thinking about how we can enhance and distribute giving in the 21st century.

Another angel has talked about new types of Blockchain related tech in question -#23 "BULLDOG'S POUND" Q #23 I think after Banff or even at Banff discussions can start regarding what other tech we can use and what apps we could draw upon to help people ,and maybe give digital blessings out to the needy – but that discussion is for another time, and I hope you appreciate that. Sorry to edit out your lovely question, but this way you can get all the info into your post and not my one. I will look forward to reading It. I feel that's what HAS is about exchanging ideas, and best one wins, so keep em coming people. We are going to change the world with the great ideas and lovely energy created here.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

UPDATE AUGUST 21, 2022

QUESTION 50:

Hi Bulldog, Today, 7/20/2022, Alexander mentioned about Shiba Inu but he gave us a white paper about Shiba Inu Classic (Shibic). They both are separate crypto in the exchanges. If we Angels already have Shiba Inu (Shib), do you think we should be fine. Or do you think we should buy the Shiba Inu Classic (Shibic) to have the bazooka effect (in Alexander's words, LOL.)? Thanks for keeping the files on all of the questions on cryptos. They are a handy reference for all of us.

REPLY FROM Bulldog:

Thank you for the question. Let me take a look, so I think I understand what you are seeking from this question, but please understand this skates very close to my no-go areas of conversation here - at this stage. But first you all know what I am going to say now - drumroll and dramatic fast paced movie music please....

the mission (should you choose to accept it) is to decide how many BTC Bitcoin "Sullivan Slivers" you want to go for – each one is 1.111% of settlement and get that put safely into Cold storage Arculus/ledger/trezor wallet first. This message will not self-destruct like in the movies its to full of love... From my perspective that's the mission got it, good.

Ok enough fun where was I?

Oh yes back to your question, no guidance or advice has been given or no bigger discussion regarding buying Shiba Inu SHIB for the group as a whole has taken place. I will quote Alexander from [**JULY 20, 2022 - CHAT NOTES & ARTICLES #1**](#)

"be very very very cautious w Shiba" "just be smart about your covenant in relation to Shiba it's not for everyone" "But after the Sullivan Sliver.. you need to ask yourself what the future looks like and how you and your family function in it " "children will become trillionaires in Shiba Inu that's why i say be careful if you thought the zim was a loaded gun, Shiba Inu is a bazooka"

May I express my personal perspective here in relation to my understanding of where we are with this , you are not being given any guidance here about this after the long six years of HAS training, you have your settlement blessing and it will be a surprise, you do not need banks and are liquid in your Treasury account from day 1 , if you choose a hedge into BTC that hedge in eight or so years will grow from 1% back to the original full settlement amount.

If buying 100T Z note for say \$100 - got you us\$18million and that 18 million and that gets you 900 BTC Bitcoins at 20k each and in time may be 100x so that's about \$1.8 billion- TBH the zeros really are not the point here, do you want to go down the rabbit hole of Shiba Inu and another huge multiplier and a further elongated time delay?

What does your heart tell you?

What does Christ tell you?

Because only when you have the questions can you answer the Shiba question as intimated by Alexander in his post as quoted above.

Is the way forward clear and defined yet? maybe, I believe not yet, hence the "be careful signs", do we all need time to process, take stock, and spend some us time before Banff and then make the biggest life changing decisions in a new perspective ? , I believe yes. But we are all on a individual path of covenant and no "one size fits all". If you have indeed on mass bought huge amounts of Shiba Inu SHIB even 1.111% you are on your way and have already answered your own question. [Shiba Inu- CoinMarketCap](#)
For Academic purposes only and not buying guidance let's make that clear - as to you point about the white paper [ShinaTokenWhitepaper-v1.0](#), these documents are the first draft outline proposals for any new idea/concept, the blueprint mk1 ideas so to speak, think of eBay as a concept , very different from the eBay now of PayPal and instant checkouts, multiple funding sources etc, you had to send a money order or drive over and pay for your goods back in the day, but it's still based on the original eBay idea, does that make sense ?.

Shiba is a concept an eco-system and many coins and tokens are issued around it. Shiba Inu SHIB is the coin we are talking about now as the current incarnation of that white paper idea, the other tokens and coins have other functions in the ecosystem like many of the other Bitcoin named or forked coins tokens, we are only looking at BTC Bitcoin. these coins and tokens are evolving and from time to time developers/miners cannot agree on the way forward, and they agree to disagree, it's called a HARD FORK [Guide to Bitcoin Forks](#) -be careful, maybe its block size, maybe its protocol speed, maybe its block nodes or rewards, and they agree to split, sometimes they call the new coin "classic" it can be very confusing but you would have to follow all key developer groups to know who is who. A copy of that blockchain is made and then both new coins/tokens are mined into existence, this explains many of the like sounded names. Bitcoin classic is a copy of the Bitcoin blockchain when it split, Bitcoin cash is a copy when it split, we are only ever putting our focus on the BTC Bitcoin, or Shiba inu SHIB, which are in my mind the original ideas concept in current incarnations. This conversation has gone way off my remit so I will end this here, this is another conversation for maybe Banff and post Banff.

I leave you with Alexanders quote again "be very very very cautious w Shiba"

My final parting - is BTC/ZW\$/TDP enough for your covenant?

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 51:

Subject: Ledger and cold wallet.

Question: How do I go about applying for a ledger and cold wallet ? What costs are involved, and do I have to wait till after the invitation to activate my account before I can apply for them? Can I apply from my iPad or does it have to be done by iPhone? Thankyou in advance for your advice.

REPLY FROM Bulldog:

Thank you for the question. Now from your message I can tell you are not in the mainland USA, so this is a good question to talk about all the other world areas and using and getting ready with a Ledger Hardware Cold storage device.

Sorry to the majority of readers in USA this will not apply to you , so I have included a nice link of funny cat video as a bonus : [Funniest Cats 🐱 - YouTube](#) now back to all the UK and other angels that need ledger – wait where are you all , no stop that cat video we are over here , I just knew I should have used video of puppies instead,.....OK all still now great.

All joking aside we must have lighter moments and enjoy the experience this stuff is not scary it's just new that's all, we can do this. Now some people have newer phones and computers and have the means to buy these now pre blessing and do more testing, some do not, some just have to take it slower, and maybe upgrade devices and plan things at a slower pace, my advice do not go into any fear of missing out FOMO mode. If you were meant to wait and take your time IMHO so be it. No panic, no fear, we are just abundance, certainty of purpose, and lots of Love. Please never feel rushed to do things now.

Now let's take an in-depth technical view for ledger users and areas -it's a thumb drive sized USB device – very different from the nfc based advanced credit card sized device used by many here the Arculus. But it's still a world class and current market leading piece of technology, and it comes in two types the new "ledger Nano S plus "and the flagship Bluetooth enabled "Ledger Nano X" also "ledger blue" and "ledger Nano" are older now discontinued models from a few years ago.

In the UK the "Nano S plus is about £70" and Ledger "Nano X is about £130" an overview can be seen at the website - [Hardware Wallet - State-of-the-art security for crypto assets | Ledger](#) and a comparison is shown here [Ledger Nano X vs Ledger Nano S Plus - Hardware wallets comparison | Ledger | Ledger](#) now if you are not going to use wireless and even though I own a model X I still plug in with USB – you may need the cable kit extra to connect to USB-c etc, the cable in the box is standard computer USB – the kit can be found here [Ledger OTG Kit | Ledger](#) IMHO buy ledger X and cable kit.

Now you need to think about what platform you run the connected software on – obviously as we have talked about on previous Q+A the cold storage hardware device in this case "the Ledger" is just a store for private keys, it's the "app" the software program you download depending on your device preference that connects you to your blockchain of choice and this is where your BTC bitcoin is stored. [Ledger \(Cold Wallet\) Questions & Info](#)

From your question, you do not need to wait in fact we have all been training away for some 8 weeks setting up exchange accounts buying test small amounts \$10 or £10 or Euro10 etc and moving them around with a wallet to wallet transfer – see link[How To Do A Wallet to Wallet Transfer](#) -

The ledger software or the app is for a PC win10/11 called ledger live (desktop), now for mobile devices being apple its in the Apple app store and its "Ledger Live: Crypto & NFT App" – now for Android phones its in the google play store and its "Ledger Live: Crypto & NFT App" Please note ledger software is not supported on tablets. This is a quote from ledger "We do not recommend running Ledger Live on an iPad or tablet. While you might be able to install the app, Ledger Live wasn't designed to run on tablets. As such you might run into multiple display and software bugs that might considerably degrade your experience of using Ledger Live.12 May 2022"

Also Ledger Live is not supported on Chromebook computers.

Just some technical notes here on which app you can use with which device

Last updated: April 29, 2022 from ledger website-

Ledger (Live mobile) requires smartphones with at iOS: Apple iOS 13 or later [iOS version history - Wiki](#) – and for Android: Android 8.1 or later [Android version history - Wikipedia](#)

note:

For regulatory reasons, Ledger Live Mobile is not available for users in the following countries or regions: Algeria -Bangladesh-North Macedonia-Nepal - Iraq-Egypt-Iran-North Korea-Syria

ledger Live (desktop software on either desktop or laptops) is Windows 8.1 (64-bit) or later (I would use windows 11 64bit imho) - macOS v10.14 or later - Linux Ubuntu 16.10 (64-bit) or later [Ubuntu version history - Wiki](#)

notes on apple mac:

Ledger Live supports macOS Big Sur on Intel-based Macs. Ledger Live should work on computers powered by the Apple M1 chip and installed macOS Rosetta. However, some users still may face some issues in Ledger Live with the Apple M1 chip and Rosetta.

Does Ledger Nano S work with Apple you may be asking? Both work with the Ledger Live mobile app, where investors can check crypto balances and make online transactions. But Nano S users can only access Ledger Live via a Windows, Linux, Mac desktop, or Android 7+ device. (From ledger support)

Does ledger work with iPad pro? We do not recommend running Ledger Live on an iPad or tablet. While you might be able to install the app, Ledger Live wasn't designed to run on tablets. (From ledger support)

Now the Ledger device itself will need to be updated i.e. the (firmware – or the program inside) will from time to time and this can be a challenge, it had to be done with a cable and on ledger live not the Ledger mobile app. Saying that until recently that was the case, but I see now from an updated notice it can now be run on android, but you will still need the USB cable kit as mentioned above. Nothing about IOS mmm

Ledger live install doc is here help with [Ledger Live – Ledger Support](#)

Just for ref the current firmware version is 2.0.2 .

So, if you are starting out and just want to make it easy with ledger

Buy a Nano X device hardware cold storage wallet, Buy the cable addon pack, and always buy from the official store never eBay or 3rd party and always generate your own seed words.

buy a new 2022 model android smartphone (this does not need to be a most expensive one in fact mid-range is fine (I use a £127 sim free android 11/12 phone) one further point my phone is android one – which means it's a non addon version of android without all the bloatware and addons that cause so many problems with secure apps , it also guarantees a year or two of free o/s updates so it will not be out of date quickly, maybe important if we lock these away in bank safe deposit boxes for years.

Now Ledger Live mobile requirements are shown above. You can then run firmware updates and install ledger live mobile on this – create the master link between the two and this is paired for life. I would consider looking at a sim free mobile phone, you will not need any contract to upkeep if the thing is to be switched off and kept in storage for years. This is then a cold storage phone effectively, its offline and very secure. Pop these both, i.e., the phone and charger along with cables and the ledger and cables (not the seed words) all into bank security box and your as safe as you can be. You can connect all these phones without sim card to any Wi-Fi signal and do all your updates and transactions that way, very very simple. If you require this to be a fully mobile walkabout device, get a data plan with the cell phone and use Bluetooth and your off to the races as we say here in the UK.

Planning the equipment based on preferences and what feels good to you is essential and remember the tablet will not work. If you choose an iPhone, you may need a desktop mac or pc to update the firmware from time to time.

You can install the same ledger app on phone and pc btw, but that's only one it does not work if you need a policy of redundancy and many ledger devices to split your holdings of BTC please see previous Q+A.

Once you have the hardware to run this sorted its super easy, connect your device to Wi-Fi - and update your phone over and over until its fully UpToDate first. Then check for phone system updates and do that until it truly is fully up-to date. Half of all problems are caused by this step not being done IMHO.

Install ledger live. then update ledger live and pair with your Ledger device, update your ledger device. Now you will need to generate the seed words these are 24 words random generated from a predefined list you need to double check and write down yourself, do not let anyone see these and never give these out, if anyone gets this list, they can recreate your wallet please be aware of this. Then install the assets you want to create a wallet for, in our case its just BTC Bitcoin now. Take a note of the BTC Bitcoin

public facing wallet address and give that to your OTC broker to deposit in good time when ready.

A good guide and many video links can be found in the post :

[Ledger \(Cold Wallet\) Questions & Info](#)

So many combinations are available I think just presenting this data in a technical paper and spelling out the planning requirements is the best way forward for now, as opposed to any step by step guides, lots of these are available and many are in the link above. Thank you for staying with this long post today.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

QUESTION 52:

Subject: Cold wallet in a will / Security needed.

Question: Hi Bulldog, I've been wondering if the biometric security feature on our Arculus cards makes it difficult to pass on the value on the cards to the recipients in our will in case of sudden death or accident? Just wondering, thank you,

REPLY FROM Bulldog:

Thank you for the question. Succession planning okay - In case we die – well may I say upfront – we do not want to generate any fear in the response or asking of this question but it's a good question about estate planning, and best to be safe than sorry I always say, so we will take a look together shall we. No fear no worry just good housekeeping.

My personal feeling is the way we set up our mobile devices with layers and layers of security is not the same as we should handle a cold (placed in bank vault) Crypto hardware wallet and mobile phone combo. You are right in your question I think too much front end security will cause problems later, but all risk must be balanced.

The cell phone you walk around with can be lost stolen etc and needs robust security to stop casual intruders, so face recognition, fingerprint (all biometric) advanced passwords and symbols onscreen locking in many instances is essential. Many apps are installed then another layer of

security is added with 2fa – txt codes sent, or email codes sent along with strong passwords of a complex nature to protect the data within, especially Banking and money apps and now the new Crypto apps including the Apps that control Arculus/Ledger/Trezor cold wallets. The Arculus card uses NFC to pair with the cell phone.

Now we know from our training the BTC Bitcoins and others are held in the Blockchain not on the card, and that the “App for Arculus/ledger/Trezor” is the access gateway to seeing your assets on the Blockchain, we also know that the Cold storage Hardware device is just a Key, a very secure key but a key no less. So the security is held within the cell phone and the “app controlling the wallet” not the card. These are Self Custody wallets after all. Your next gen banking card may have fingerprint but not the current cards to hold offline cold storage crypto Assets.

My Plan Explained:

Your App, either Arculus app or ledger Live app etc will ask you to enhance security as you progress with its use, in many cases this extra security can be turned off and the simpler (riskier) pin code only used. And that is what I will use for my (bank vault) cold storage devices. My cell phones will also have no extra apps installed, they will have a new email address and none of the baggage of my day-to-day walkabout phone. Even though the mobile phone does support face recognition, fingerprints, I will not use them, not even a screen lock, I will set it up without a sim card and only use Wi-Fi (if possible) as it will be in a bank vault. I will also use an anti-virus/anti spyware family pack program (app) and install just to be safe with cyber security. [**6 Best Antivirus Software for 2022 \(safetydetective.com\)**](#)

no need for complicated VPN etc. and when I need to get this out of storage. I will update the cell phone software first then update the Arculus / ledger App then update and run a security scan before transacting any Crypto business, easy, safe, secure.

A few links to switching features on/off for various devices are below:

[**How do I enable/disable fingerprint/FaceID? – ARCULUS**](#)

[**Set up password lock – Ledger Support**](#)

[**Secure Two-Factor Authentication with TREZOR – U2F**](#)

So, the Cold Storage cell phone has no security enabled – or very light touch and then the crypto APP has pin code access and that I am sure is an essential integrated option non-negotiable. And I will make sure my lawyer has access to the Vault to access if anything happens and then transfer to my successor. My seed words recovery phrases and login pins can be stored separately, and the lawyer has access to them.

Now for my walkaround day phone and (Luke warm) ledger device I will have in the house it will have all security switched on, the same with my day-to-day cell phone, security and privacy here is paramount.

Interesting that internet searching today about this subject is limited and Arculus as a new company has nothing about this on its website, other articles do exist, but we must put these in perspective. From my understanding we are awaiting huge changes to law, both domestically and internationally, regarding the treatment of BTC Bitcoin and CBDC digital assets. I call this the “full regulatory Legal framework”, and as of writing this, much does not exist. In time this will change over, it could be a short period of time indeed post settlement, lots is being done behind the scenes. We are just early adopters here, so must make long term plans. What is codified in all law is that assets can be transferred on probate to your successors, but you must be able to unlock them first.

I enclose a few links of limited value given the above statement, but included here for FYI anyway:

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

UPDATE OCTOBER 18, 2022

QUESTION 53:

Subject: Last minute concerns and questions.

Question: Hi Bro B, I have several concerns about cold wallets. Please clarify the following bec I still can not grasp their rationale:

1). We could store 50,000 BTC "coins" or is it \$50,000 "total amount" worth in USD, per each cold wallet?

2). Why do we need to have one cell phone and one laptop, exclusively, for each cold wallet?

3). If we're buying three different cryptos, for example: BTC, ETH and SHIB, can we store all three in ONE cold wallet, (if we observe the max #of coins or worth of our purchases), or ONLY ONE type of crypto per cold wallet?

4). Cell phone models and lap tops we purchased in the year 2022 might or most likely, be obsolete 8-10 years from now. Plus the fact that some of HAS members (UHNW), might need to buy several cell phones and lap tops for each of their purchases, if this is the case.

5). How would we access what we stored in each cold wallet 8-10 years from now, if those phones and or lap tops becomes obsolete?

6). According to Caleb and Brown OTC Agent, their company is offering their clients a "cold wallet vault" (backed by their own insurance 100 %), and they hold your "seed phrases!" Knowing what HAS members already knew about BTC purchases, what's your pros & cons to their offer? If my questions have been asked before, please accept my apologies for redundancy, and or please refer me to the date & Q&A #, when you answered them. Sincere gratitude for answering and clarifying my concerns.

REPLY FROM Bulldog:

Thank you for the question. So, this is big Q+A today half a dozen questions wowza, and hot diggety dog. But seriously, I can see from your asking you need to work through this, so we will take it slow and get through them one by one, anything you don't get just PM me. Many of the concepts and ways of doing things discussed in the training Q+A and in the advice kindly shared by Alexander are a sort of best practice based on experience and certainly from alexander - divine guidance received- for me I just take this as gospel and run with it. Always more than one way of doing something is available but my thinking is why reinvent the wheel every time? it's all been thought out, relax its all Zimple...love that saying.

Here we go:

Ans #1)

Fifty thousand is coins not dollars, so 50,000 BTC Bitcoins or in US\$ terms about US\$1Billion at 20k per BTC coin is good practice as a total for one device – the reason is you do not want to stand out as a big player when people lookup the largest holdings (and they can and do) on the blockchain see - so being under the radar, quiet and stealthy means not standing out – it's safer. They are not looking up your name of your keys just your public facing wallet address – very much like your home address and zip code – it's not a secret. I probably won't even load 10,000 BTC per hardware device for extra security, see the link above in the table (at time of writing this) it shows – only 5 address have 100,000 BTC or above but 94 have 10,000 to 100,000 BTC, and 2051 wallets have 10,000 BTC max, so less standout and potentially safer for holders, a much better place to be for your safety and security IMHO, and nothing to do with capacity of the device. In theory all the BTC Bitcoins in existence could be held on one device FYI, but that would just be silly.

Ans #2)

One cell phone/Laptop per card or hardware wallet because as we know from the training, the blockchain stores the Coins, the APP or program on your phone or computer controls/shows you the coins and the Hardware wallet – Arculus/ Ledger/trezor stores the keys and protects access. Depending on where you are in the world you will have options from the above list (it is not exhaustive) just good practice recommendations. Also, its good security that the app developer will not let any one phone (and account linked to it) control more than one device on any account and think about it, the icon or app is installed – you cannot install another instance – you either install or remove apps like “spotify or WhatsApp” one at a time, and the majority of HAS users will be using this system. PC/Laptop users have more flexibility but keep it simple.

Ans #3)

yes three or more types of blockchain digital asset can easily be stored on each individual cold storage wallet device– either Arculus/ Ledger/trezor, you are only limited by the devices internal storage memory – the ones recommended above can hold many asset classes – but that will not be our play.

Ans #4)

Laptops and cell phones will need (from time-to-time) maintenance updates and maybe a refresh, but why worry yourself about this on the eve of the greatest blessing in history. My thinking was do not buy a out of date phone or tablet now and place in vaulted storage, get new hardware and give yourself the longest longevity possible. If you are lucky enough for UHNW then you need to manage that in the long term after all its your money and your responsibility, I will be getting my devices back every year doing updates and anti-virus scans – doing any hardware refreshes and firmware updates and placing back into the bank vaults. Just like updates on your walkabout phone or laptop in your hands it needs management from time to time but its not a big worry its easy.

Ans #5)

They will not be obsolete – please don't over think this, please don't go into fear mode of what ifs. You are sovereign and have Christs hand on your shoulder, you, we, all of us will be guided to do (when ready) sensible maintenance and updates for our digital assets and storage Hardware wallet devices, we will inform each other and have a circle of advisors to guide us. Showme will have his new shiny HAS HQ and a Crypto Guru will be installed you will never be alone you will never lose your assets if you are sensible and do the planning as suggested, and you will never be without help, of that IAM sure.

Ans #6)

Caleb and Brown are an OTC broker – one of the biggest, and again depending on where you are in the world, some geographic areas will mean this is one of the only choices for you. For the larger HAS audience in the room in general they should consider Coinbase and Kracken etc which are very good world class choices. Now when I talk about Cold storage, I am taking about self-custody, we know from the training the "Private keys" are the bit that never gets given out, these unlock your wallets and are like house keys in many ways. Caleb custody mean they have the "keys to your door" simple as that. The risk of any OTC broker running off with your money or going broke during the transition is near zero, Christ is in control of this, but years and years down the road during a certain depression type events, I think it is most prudent and sensible to protect your settlement with "Self-custody keys" i.e. hold your own Cold storage Hardware device and the keys within under your control. As for Insurance well remember credit default Swap insurance – that worked out well last time the brown stuff hit the fan. Seed phrases recreate wallets in case of loss or breakage – these are 12/24 words and are to never be given out, the private keys are the secret numbers that unlock your device for every transaction IMHO you should have control of both in your own hands for now, certainly until things

have settled down. If Caleb hold your keys its well a HOT wallet not cold in many ways. As mass adoption and institutional money flood into the crypto space (post blessing) and laws and regulation are unfolded, Custody like the one you have been offered, will become better and better, safer and safer, but for now be careful.

Oh a couple of last things firstly – with Caleb & Brown , please double check in your account and speak to your Broker I have been informed as of 20th August 2022, they have updated the banking information for USD, AUD, CAD and NZD deposits. It does not affect British Pound deposits. My email says, “If you have sent funds recently there is no need to worry, these funds will still arrive into our account and be ready for trading”.

Please remember Alexanders updated advice - to hedge your settlement value – you do that by buying at least one Sullivan Sliver equal to 1.111% of your total settlement and put it into BTC Bitcoin on a cold storage device.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

David aka Bulldog

QUESTION 54:

Subject: BITCOIN FOR DUMMIES OR JUST ONE DUMMY?

Question: Dear Wonderful Bulldog! I have a question that probably most understand but I don't. :) I get it that I should, and I will buy 1,111% Sullivan Sliver to protect my "mother sum" so I and others can continue philanthropical work. I understand that during the coming 8 years the value of BTC might reach very very high... But what do I do in the year 2030 with all that BTC? I am supposed to have it on my ledger and wait 8 years... Do I sell BTC and get "money back"? and then fund new projects? Do I pay with BTC? Will it be common to directly buy with BTC and fund projects? Please explain in practical details what/how use all the BTC 1,111% that I have "saved" for every project I am funding. Hope you understand my question that is from a "dummy" :) Thank you!

REPLY FROM Bulldog:

Thank you for the question. Now I could go on about the disruptive technology being DLT Distributed ledger technology and how that will change

the world, I could speak about the introduction of the new accounting system via BTC Bitcoin and how it will impact all areas of your life in the future. I could talk about blockchain technology and tokenization of everything as it is sound accounting being triple ledger, which is coming. I could talk about the old system and the fact that brick and mortar banks giving out pieces of paper are toast, BTC Bitcoin forces sound money, just can't raise the debt ceiling and print, print, print. I could go on about smart contracts and commerce and the fact BTC Bitcoin is the one coin to rule them all via the introduction of the working concept of this blockchain technology.

You all know by now I'm a huge BTC/crypto fan. I could talk for hours all excited about this stuff and sometimes do. In fact, I had a whole thing written today for this Q+A, selling the case for BTC Bitcoin the new systems – the use cases – new technology and infrastructure QFS etc etc, where I see things heading. Lots of answers regarding your question - my ideas, and things I expect to happen After I finished, I took some advice from someone I respect, and removed it all, pages and pages- it took most of the morning to write, the fact is I realized it's not my place to overreach and speculate in this Q+A space. I do not have a roadmap of what how who and where – sorry.....

My perspective is after buying BTC we will still have a pile of cash left on day one to give away gift spend set up safe havens for the next few years and no need for banks. We will use cash for everything, and I mean liquid funds cash (not paper bills) we do not need to let anyone know what we have or where it is – safe secure sovereign, and no banks, with BTC Bitcoin safely stored away for now.

Go slow and just have FAITH, faith in HAS to get you the best information regarding things you currently do not understand, and maybe for security cannot be revealed right now. I have faith Alexander and his unique insights and messages passed from the highest source, the HIGHEST, say acquire and hold BTC Bitcoin as a hedge. If you are doing that mission done. Now time to be good to yourself and heal YOU first.

IMHO a whole new financial and regulatory system will be unrolled in front of our eyes, and all the need-to-know info, will be here at HAS, given as guidance exactly when it is needed.

It's your money when you settle, and your choice, I would urge anyone on the fence to read the excellent post of 22 Aug Apex

[apex-has-post-monday-august-22-2022](#)

Please remember Alexanders updated advice - to hedge your settlement value – you do that by buying at least one Sullivan Sliver equal to 1.111% of your total settlement and put it into BTC Bitcoin on a cold storage device.

Sorry its not the answer you were maybe expecting today.

I Hope this is informative and has helped with peoples understanding – its shared with much Love.

David aka Bulldog

QUESTION 55:

Subject: New Phones and planning.

Question: Thinking about getting new Iphone14. Just thinking I can't get rid of current phone if it's linked to two of my crypto accounts. Correct? So, if new phone I need a new phone number, etc....?

REPLY FROM Bulldog:

Thank you for the question. Now a direct to the point question I like that, so my very direct answer today is – nobody is saying you cannot get rid of any phone.

This is all so easy trust me, take a deep breath and think about this, – for years we have all been updating our cell phone numbers and emails address on ebay/Paypal and our Amazon accounts and our banking Apps etc, you did this with ease, no different here with your Crypto Exchange or Bitcoin apps on your old phone.

The reality is only you know how you organize your life, your logins, your linked passwords/accounts, and the associated apps you will use. I would suggest best practice is a separation between your walking around “day to day” personal mobile phone and your TDP work, so maybe a separate device to run the Cold storage wallet app is not a bad idea at all. But ultimately it is your responsibility to manage your wealth. Be smart be sensible don't walk around with all your money, keep things safe.

Please remember you can of course go into any account you have with a crypto/Bitcoin exchange or cold storage wallet APP, and update new phone numbers and emails, and after passing security, you can then have a brand-

new device linked to an existing account – then delete old phone/email numbers when updated and replaced. You will need to pass lots of security – and yes, it's a pain, but that's a good thing, it is keeping you safe online in this new age of Blockchain.

I think the question to ask yourself is this Planning– look at your blessing amount total and decide how many Sullivan Slivers you want to acquire? – use your blessing amount in local currency i.e., us\$ terms then divide simply by say \$15,000/ or \$10,000 (whatever as an average price to buy BTC Bitcoin), just as a calculation, now you have a guesstimate on how many BTC Bitcoins you need to acquire, it's just a guess. Now look at guidance regards max to hold on any single cold storage device well its about 100,000 BTC coins- please see [How many cold storage devices needed - **bulldogs-pound-question-answer-45** -](#)

Along with sizing and Last min concerns - / [bulldogs-pound-question-answer-53/](#)

This calculation from above will dictate to you, how many cold storage hardware devices (Arculus USA/ ledger Trezor rest of world) you need minimum, and these will need to be linked to a separate device each to run the app. Remember in the most simplistic of terms, - the Cold storage hardware device is only a "key" , the app is your "access gateway", and the Blockchain is where all the magic happens and everything is stored.

I would not advice walkabout day to day mobile device be linked to any big holdings of anything for security, either banking, or crypto, or exchange accounts, in any form, just use it for day-to-day banking email and all your normal phone usage. It may also be prudent to close all the old "Crypto trading accounts that are not "OTC", as you do not need lots of these post blessing. Unless of course you wish to continue day trading in penny stock cryptos markets. Remember Blessings = Burdens.

Final footnote Alexanders updated advice - to hedge your settlement value – you do that by buying at least one Sullivan Sliver equal to 1.111% of your total settlement and put it into BTC Bitcoin on a cold storage device. This is self-custody – you have control of the access keys.

I Hope this is informative and has helped with peoples understanding –

Love is the Answer- Love is the Prayer

Bulldog

QUESTION #56

Subject: Dual sim Phones and BTC apps.

Question: Not a question per se- Most newer phones are esim capable, giving one the ability to have 2 phone numbers on the same phone as long as your provider supports it. Your thoughts?

REPLY FROM Bulldog:

Thank you for the question. Ok I do see where you are coming from on this, why buy two devices when one can do both, can I explain it like this maybe.

Having a dual sim phone just does not seem a great idea for me. The Operating system and memory card on the phone will have to be shared, only the sim card is separate on this dual sim setup, but maybe it can work for you.

I see this as not mixing a daily walkabout mobile phone for either work or TDP with your core holdings and safe BTC Bitcoin vault. Your rich, a few hundred bucks on another phone is a no brainer. In fact, buy another Arculus for walk about fun/training etc and link that to your day-to-day phone is maybe a good idea. Remember Blessings = Burdens, we all must manage our wealth.

The blessing in its form will be huge – huge in its meaning, and huge as everybody here has never managed UHNW money, my perspective is we must take sensible precautions and security as a priority without going into fear mode. What I mean from that is don't leave an Arculus packed with millions in BTC Bitcoin lying around on a desk, but also no need to build a guarded bunker to store them either. The technology exists with your seed word recovery to recreate the thing if broken, so keep these words safe. Having the phone offline and linked to one Cold storage device seems good practice.

Just some notes the group may find useful:

In USA the Arculus app and card will run on a modest phone \$150-300 – and you must have NFC switched on.

The Arculus Wallet™ App is currently compatible with Android version 8.1 and later and should work on any Android phone that supports NFC. For Apple iOS, the Arculus Wallet App will work with iOS version 10.0 and later, but only iPhone 7 and later models are supported.

This technology does not work on desktop computers.

In the UK/Rest of world- we use Ledger and it will run on a sub \$200 phone – and all should get the OTG cable kit for easy use and flashing/ updating from time to time, something our USA friends do not need to do with Arculus – now the app is - Ledger Live mobile APP: it runs on –

iOS: Apple iOS 13 or later , and Android: Android 8.1 or later. Now Ledger Live on Desktop program uses - Windows 8.1 (64-bit) or later and macOS v10.14 or later, also Linux Ubuntu 16.10 (64-bit) or later <https://humanangelservices.activeboard.com/t68339626/arculus-cold-wallet-questions-info-can-be-answered-by-other-a/>

fyi ledger will not work with tablets. <https://humanangelservices.activeboard.com/t68339630/ledger-cold-wallet-questions-info-can-be-answered-by-other-a/>

Please check the Crypto section in HAS where many members post everyday about updated ideas and tips, and a good perspective and guidance can be found in the excellent post by Godfather on security - see

<https://humanangelservices.activeboard.com/t68802281/godfathers-fyi-saturday-september-24-2022/>

Final footnote Alexanders updated advice - to hedge your settlement value – you do that by buying at least one Sullivan Sliver equal to 1.111% of your total settlement and put it into BTC Bitcoin on a cold storage device. This is self-custody – you have control of the access keys.

I Hope this is informative and has helped with peoples understanding –

It is shared with much love.

Bulldog

QUESTION #57:

Subject: Where to Start from

Which apps are good to chose from to purchase coins for our hot wallets/ cold wallets and otc brokers Thanks for your help

REPLY FROM Bulldog:

Thank you for the question. The apps you talk about are linked to trading accounts from "exchanges" or "OTC brokers" and if you control the keys with a device or card then its "Cold storage wallet" and if you just login to an account it's a "hot wallet". Can I suggest we take a look together and get you a step-by-step guide into BTC Bitcoin and use this as a recap of our training here so far in HAS? Ok thank you.

Lets begin at the basics shall we -

BTC Bitcoins are bought from specialist stores called exchanges (not banks at the moment) you have to set up an account and they need ID – the process is called KYC Know your customer and includes taking selfies (without filters or cropping) and proving proof of address etc, all standard stuff. Depending where you are in the USA and for that matter where you are in the world, not all exchanges operate in all provinces/areas/countries – if this is the case just find another Exchange (or broker for the sake of a better word) the big ones are Coinbase – kracken – Gemini – Binance etc etc

<https://thecollegeinvestor.com/21245/top-10-bitcoin-crypto-investing-sites/>

Ok – when you are blessed with your settlement – you will need to calculate how many Sullivan Slivers you want at 1.111% of total settlement and you will then know how to size you BTC Bitcoin holdings , now buying this will need a BTC Bitcoin wholesaler not just a store, and these are called OTC traders , private bespoke service deals – sometimes one to one, but a tailored service that buys picks and packs your order for you, you do not have to use the same company you setup with in the training (for a hot wallet and small \$10 test trading Exchange accounts above) – but you will need more KYC so get used to it. <https://99bitcoins.com/buy-bitcoin/large-amounts-otc-broker/>

All apps are wallets – and a wallet to wallet transfer experience is essential training – I have mapped one out for you here <https://humanangelservices.activeboard.com/t68445302/how-to-do-a-wallet-to-wallet-transfer/>

The wallet address or the public facing wallet address is like a mailing address not secret and needs to be given out so people can send you BTC inward – but the private keys are to be kept very secret and secure.

Now with all this new wealth purchased with OTC in digital assets in this case BTC Bitcoin, no physical paper or coins are ever delivered, think PayPal, no cheques no ATM card, just online credits you have and spend on eBay etc, everything done online. Now these digital BTC Bitcoins can be stored in any wallet. You can almost make one up (a wallet) without a company or exchange it's called a "paper wallet", and you guessed it people did print these out in the past, wash the jeans and loose the lot. Max Keiser reportedly lost a fortune in BTC Bitcoin back in the day when his wife Stacey washed the numbers away, but that was ten years ago and now is now. You can keep BTC Bitcoins in a online account called a hot wallet , you only have the account password as security and the private keys are held in custody for you, you have a counterparty risk if the account becomes illiquid, some would say if you do not control the private unlock keys for your crypto you do not own your crypto , but we will not go into a tail spin of fear we just need to be careful and respectful of looking after this great blessing. So hardware wallets were invented, a usb sized device that holds the unlock private keys to send BTC Bitcoin or any crypto making this very safe..

In the USA states that allow Arculus is a great easy solution – it's a metal credit card sized security key that unlocks your Arculus APP , and this stores and digital asset you buy , the Arculus also verifies with its key any sell or move transaction you want or execute (hence the private keys) The Arculus APP is mostly loaded onto mobile devices and uses a wireless technology called NFC.

This is a self-custody wallet as you control the private keys. Arculus links below:

<https://humanangelservices.activeboard.com/t68339626/arculus-cold-wallet-questions-info-can-be-answered-by-other-a/>

<https://humanangelservices.activeboard.com/t68781417/how-to-set-up-your-arculus-wallet-videos/>

Now the rest of the world has a choice – Ledger – is a usb thumb drive type device that holds the private keys and is controlled by LedgerLive app, this can be Bluetooth ledger Nano X model and you can buy OTG cable connector kit for firmware flashing (get used to maintenance on these devices gang) and can be loaded on mobiles – laptop and PCs both windows Mac an Linux

– but no TABLETS. This is a self-custody wallet as you control the private keys.

<https://humanangelservices.activeboard.com/t68339630/ledger-cold-wallet-questions-info-can-be-answered-by-other-a/>

Another Great choice of world class proportion is trezor and this is a 3inch fob type usb device similar to car key fob in appearance, this is favoured by many and is Android phone (with cable connector kit) and pc with usb – it has big colour touch screen and very highly rated , it comes in various colours and can be fitted with lanyard etc. trezor has its own control app. This is a self-custody wallet as you control the private keys.

<https://humanangelservices.activeboard.com/t68339634/trezor-cold-wallet-questions-info-can-be-answered-by-other-a/>

Now lots of other hardware wallets exist – now please remember most of these ten best of anything sites or videos are paid and bias to one brand – so look around and do your homework – get your own tingle on what you need – above are three world class options but if you want more here is one such comparison link for you - <https://99bitcoins.com/hardware-wallets/> these are all self-custody wallets as you control the private keys.

All hardware wallets are protected by seed words – sometimes 12 or 24 words generated from a bip39 list and need to be kept very safe – never show these to anyone or give them out – you can loose everything if you do. If you break or loose your device, you simply get another one from the store and use these recovery words to recreate the wallet in its entirety like magic – things are very safe on the new Blockchain DLT systems.

Final footnote Alexanders updated advice - to hedge your settlement value – you do that by buying at least one Sullivan Sliver equal to 1.111% of your total settlement and put it into BTC Bitcoin on a cold storage device. This is self-custody – you have control of the access keys.

I Hope this is informative and has helped with peoples understanding –

It is shared with much love.
